# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXX.

FEBRUARY, 1925.

No. 2

### GENERAL SUMMARY.

February was remarkable as being one of the few warm winter months; in but four other instances has it been warmer in either January or February in 40 years, and in those cases there was but slight excess above the 1925 record. It was persistently warm for long periods: on the 1st, 2d, from the 5th to 12th, 14th to 17th, and from the 19th to 25th, averaging for the whole State, 7.5° above normal. There was but one snowstorm and that amounted to but little over an inch in the northern counties and less than a tenth of an inch in southern districts. Snow cover which remained on the ground from January was rapidly depleted by the warmth, and depths of some 20 inches in northern counties had melted by the middle of the month. This general thaw, together with a generous rain of the 10th, 11th and 12th caused floods and breaking up of the ice in the rivers. The ice went out of the Delaware on the 12-13th, with a flood which slightly exceeded the record for several years, but no damage of importance occurred. Floods also occurred in the streams in the northeastern counties, and considerable damage and distress was the result. Ice remained in lakes and ponds, but frost was almost entirely out of the ground by the end of the third week. The month closed with a cold wave, when the lowest temperatures of the month, for many localities, occurred. A very unusual feature for a mid-winter month was the prevailing wind of the southern half of the State, which was from the south and southwest. Altogether it was a February of the most pleasant weather for over fifteen years.

Storm warnings were displayed along the coast on the 2d, 3d, 11th, 12th, 21st, 23d, 26th and 27th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 37 stations, was 37.3°, which was 7.5° above normal. The highest temperature was 72° at Vineland on the 22d, and the lowest, 1° below zero, at Culvers Lake on the 3d.

The greatest daily range of temperature was 40° at Belleplain and Indian Mills on the 8th. The highest monthly mean temperature was 42.8° at Vineland, and the lowest, 32.4° at Layton.

The temperature departure from the normal for the year, 1925, to date, by sections, is: The Highlands, +2.0°; Red Sandstone Plain, +1.3°; Southern Interior, +3.6°; Sea Coast, +3.0°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 41 stations, was 2.23 inches, which was 1.38 inches below normal. The average total snowfall at fourteen selected stations was 0.7 inch, which was 8.2 inches below normal. The greatest monthly precipitation was 4.64 inches, at Dover, and the least, 1.18 inches at Cape May City. The greatest amount of precipitation in any 24 consecutive hours was 1.95 inches at Dover on the 10th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 7, or 2 less than normal.

The precipitation accumulated departure from the normal for the year 1925, to date, by sections, is: The Highlands, +0.63 inch; Red Sandstone Plain, -0.46 inch; Southern Interior, -1.06 inches; Sea Coast, -1.57 inches.

### WIND.

The prevailing wind direction was from the southwest. The wind movement averaged 13 miles per hour, which was 1 mile below normal. The highest velocity, sustained for 5 consecutive minutes, was 10 miles per hour from the west at Long Branch and Sandy Hook on the 26th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 12, which was 1 more than normal; partly cloudy, 6, or 2 less than normal; cloudy, 10, or 1 more than normal. The per cent of possible sunshine was 59, which was 3 per cent above normal.

### MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.07 inches, which was 0.03 inch below normal. The highest reading was 30.51 inches at Cape May City on the 28th, and the lowest, 29.21 inches at Sandy Hook on the 26th.

The mean stage of the Delaware River at Phillipsburg was 8.1 feet, and the highest stage was 21.0 feet on the 12th. At Trenton the mean stage was 5.2 feet, which was 1.9 feet above normal. The highest stage was 13.0 feet on the 13th. Dense fog occurred on the 9th, 10th, 11th, 12th, 15th, 17th, 21st, 22d, 23d, 24th and 25th. Sleet fell on the 12th and 26th. Solar halos were noted on the 10th, 16th and 18th, and lunar halos on the 6th, 7th, 9th and 28th. Thunderstorms occurred on the 15th, 23d, 24th and 26th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton.

## Daily Precipitation for February, 1925

VOL. XXX.

MARCH, 1925.

No. 3

### GENERAL SUMMARY.

March, usually a stormy month or with successively unpleasant weather changes, was remarkable for its persistently fine weather and relatively mild temperature. No temperature records were broken, but there were only four days when temperatures were appreciably below normal. The coldest period was on the 2d and 3d, when minima were mostly under 10°, and at this time 12 inch ice was cut in Hunterdon County. Half of the days of the month were mostly clear, and the usual blustery March winds were appreciably missing. There was a deficiency in the frequency of rain, the important dates of its occurrence being on the 1st, 5th, 17th, 27th, 28th, 30th, and in northern districts on the 12th and 14th, and with scattered occurrences on the 19th. The absence of snow was another unusual feature for the month, and the scant amounts which did fall in northern counties were unimportant. The abnormal warmth which commenced the second week in February continued through March, with only slight retrogressions for a day or two at a time. As a result of such favorable early spring weather, outdoor work, both structural and agricultural, was advanced some two weeks beyond normal, and several weeks in advance of last year.

Storm warnings were displayed along the coast on the 5th, 10th, 14th, 17th, 19th, 27th, 28th, and 31st.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 36 stations, was 43.3°, which was 4.5° above normal. The highest temperature was 80° at Indian Mills on the 27th, and the lowest, 1°, at Culvers Lake on the 3d. The greatest daily range of temperature was 52° at Sussex on the 26th. The highest monthly mean temperature was 47.1° at Vineland, and the lowest, 39.0° at Charlotteburg.

The temperature departure from the normal for the year, 1925, to date, by sections, is: The Highlands, +2.7°; Red Sandstone Plain, +2.4°; Southern Interior, +4.0°; Sea Coast, +3.5°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 40 stations, was 3.47 inches, which was 0.49 inch below normal. The average total snowfall at 18 selected stations was 0.3 inch, which was 5.7 inches below normal. The greatest monthly precipitation was 6.09 inches, at Little Falls, and the least, 1.50 inches at Northfield. The greatest amount of precipitation in any 24 consecutive hours was 2.06 inches at Little Falls on the 1st. The mean of the number of days on which 0.01 inch or more of precipitation fell was 9, or 2 less than normal.

The precipitation accumulated departure from the normal for the year 1925, to date, by sections, is: The Highlands, +0.91 inch; Red Sandstone Plain, -0.16 inch; Southern Interior, -2.30 inches; Sea Coast, -3.40 inches.

### WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 14 miles per hour, which was 1 mile below normal. The highest velocity, sustained for 5 conse-

cutive minutes, was 60 miles per hour from the southeast at Atlantic City on the 1st.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 16, which was 4 more than normal; partly cloudy, 6, or 3 less than normal; cloudy, 9, or 1 less than normal. The per cent of possible sunshine was 62, which was 1 per cent above normal.

### OBITUARY.

Henry A. Jorden died March 10, 1925, at Bridgeton. He commenced observations in Bridgeton in June, 1882, and has been cooperating in this work uninterruptedly until his death, a period of nearly 43 years. Such is the public spirited fidelity of a busy man to his community and to his country. It is worthy of lasting praise and of loyal emulation.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 5.0 feet, and the highest 6.0 feet on the 20th and 21st. At Trenton the mean daily stage was 3.1 feet, which was 1.0 foot below the normal; the highest stage was 4.0 feet on the 1st and 21st.

The mean atmospheric pressure, reduced to sea level, was 30.08 inches, which was 0.07 inch above normal. The highest reading was 30.65 inches at Trenton and Sandy Hook on the 16th, and the lowest, 29.35 inches at Sandy Hook on the 28th.

Dense fog was reported on the 1st, 8th, 10th, 11th, 14th, 17th, 19th, and 27th. Sleet occurred in portions of northern and central districts on the 1st, 5th, and 13th. Thunderstorms were recorded on the 12th, 14th, 18th, 19th, and 27th. Solar halos occurred on the 10th, 22d, 24th, and 26th and lunar halos on the 7th, 8th, and 9th. No hail was reported.

### COMPARATIVE DATA FOR MARCH

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

¶ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, \*, b, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton.

Daily Precipitation for March, 1925

# CLIMATOLOGICAL DATA. MAY 28 1925

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXX. APRIL, 1925. No. 4

### GENERAL SUMMARY.

April was an unusually pleasant month, and the earlier half was especially advantageous for out-of-door interests, due to persistent sunshiny days and absence of rain. Abnormal warmth prevailed with but little reversal, and moisture and wind movement were slightly deficient. There has been but one warmer April and one drier April in the past ten years, and altogether it was a notable month for these two weather elements. It was in marked contrast with April a year ago, which opened with a snowstorm with resulting retardation to vegetation and to all agricultural interests. This year foliage and early bloom were some two weeks in advance of normal, and industrial operations dependant upon favorable weather were well advanced.

It is interesting to recall an ancient record of April, 1854, on the three days, 14th to 17th, two feet of snow fell in New Brunswick. This occurrence, therefore, may well be taken into consideration in determining safe dates of starting upon weather dependant projects.

Storm warnings were displayed along the coast on the 19th and 28th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 33 stations, was 51.4°, which was 2.1° above normal. The highest temperature was 88° at Belvidere and Paterson on the 23d, and the lowest, 15°, at Runyon on the 7th. The greatest daily range of temperature was 50° at Runyon on the 7th. The highest monthly mean temperature was 55.2° at Vineland, and the lowest, 48.0° at Layton.

The temperature departure from the normal for the year, 1925, to date, by sections, is: The Highlands, +2.4°; Red Sandstone Plain, +2.2°; Southern Interior, +3.6°; Sea Coast, +3.4°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 40 stations, was 2.40 inches, which was 1.22 inches below normal. The snowfall was a trace, which was 1.5 inches below normal. The greatest monthly precipitation was 3.35 inches, at Indian Mills, and the least, 1.31 inches at Boonton. The greatest amount of precipitation in any 24 consecutive hours was 1.53 inches at Sandy Hook on the 14-15th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 9, or 1 less than normal.

The precipitation accumulated departure from the normal for the year 1925, to date, by sections, is: The Highlands, -0.74 inch; Red Sandstone Plain, -1.75 inches; Southern Interior, -3.01 inches; Sea Coast, -4.13 inches.

### WIND.

The prevailing wind direction was from the northeast. The wind movement averaged 13 miles per hour, which was normal.

The highest velocity, sustained for 5 consecutive minutes, was 53 miles per hour from the northeast at Atlantic City on the 29th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 15, which was 3 more than normal; partly cloudy, 7, or 2 less than normal; cloudy, 8, or 1 less than normal. The per cent of possible sunshine was 66, which was 9 per cent above normal.

### MISCELLANEOUS.

The mean daily stage of the Delaware River at Phillipsburg was 3.7 feet, and the highest stage 5.5 feet on the 2d. At Trenton the mean stage was 2.3 feet, which was 1.6 feet below the normal; the highest stage was 3.3 feet on the 1st.

The mean atmospheric pressure, reduced to sea level, was 30.03 inches, which was 0.03 inch above normal. The highest reading was 30.57 at Trenton on the 21st, and the lowest 29.58 at Trenton and Atlantic City on the 19th.

Dense fog was reported on the 11th, 12th, 15th, 18th and 25th. Solar halos were observed on the 7th and 12th, and lunar halos on the 2d, 4th, 6th, 9th and 26th. Thunderstorms occurred on the 10th, 14th, 15th, 18th, 19th, 23d, 24th, 25th and 26th. The last killing frost over the State was on the 21st-22d.

Light hail occurred at several localities in the central and northern districts on the 15th. Some of the hail at Sussex on this date was up to one and one-half inches in diameter. There were scattered occurrences on the 21st and 25th. No material damage by the hail was reported.

### COMPARATIVE DATA FOR APRIL

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton.

## Daily Precipitation for April, 1925

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXX.

MAY, 1925.

No. 5

### GENERAL SUMMARY.

The month of May was somewhat remarkable for its persistent deficiency of warmth and rain and its slight excess of sunshine. There were but six days which were above normal in temperature, while there were general late frosts, and a few occurrences of snow and sleet. The greater part of the rain, which was subnormal in volume and frequency, occurred with four scattered thundershowers.

A feature of the month's weather was the sudden rise of temperature to well up in the 90's on the 23d, and which was followed by severe reactionary storms late in the afternoon. A very cold layer of air overrunning the excessive heat on the ground afforded the unstabling influences which generated the violent readjustments. Damaging wind and hail occurred very generally, and there was considerable loss inflicted upon crops, insecure structures and glass roofs. Flood tides whipped by the wind also caused injury in some localities.

Storm warnings were displayed only on the 17th and 25th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations, was 57.7°, which was 2.6° below normal. The highest temperature was 99° at Indian Mills on the 23d, and the lowest, 23°, at Runyon on the 8th. The greatest daily range of temperature was 51° at Runyon on the 21st. The highest monthly mean temperature was 60.1° at Vineland, and the lowest, 53.6° at Charlotteburg.

The temperature departure from the normal for the year, 1925, to date, by sections, is: The Highlands, +1.3°; Red Sandstone Plain, +1.2°; Southern Interior, +2.3°; Sea Coast, +2.7°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 44 stations, was 2.86 inches, which was 0.93 inch below normal. A trace of snow was recorded at two stations in the State.

The greatest monthly precipitation was 4.94 inches, at Belvidere, and the least, 0.49 inch at Cape May City. The greatest amount of precipitation in any 24 consecutive hours was 2.04 inches at Dover on the 23d and 24th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 8, or 3 less than normal.

The precipitation accumulated departure from the normal for the year 1925, to date, by sections, is: The Highlands, -0.66 inch; Red Sandstone Plain, -2.51 inches; Southern Interior, -4.44 inches; Sea Coast, -5.83 inches.

### WIND.

The prevailing wind direction was from the southwest. The wind movement averaged 11 miles per hour, which was normal. The highest velocity, sustained for 5 consecutive minutes, was 54 miles per hour from the north at Sandy Hook on the 23d.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was

13, which was normal; partly cloudy, 11, or 2 more than normal; cloudy, 7, or 2 less than normal. The per cent of possible sunshine was 66/100, which was 6 per cent above normal.

JUL 3 1925

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 29.95 inches, which was 0.04 inch below the normal. The highest reading was 30.38 inches at Cape May City on the 16th, and the lowest, 29.35 inches at Ridgefield on the 23d.

The mean stage of the Delaware River at Phillipsburg was 3.2 feet, and the highest, 4.5 feet on the 13th. At Trenton the mean daily stage was 1.9 feet, which was 0.7 foot below the normal; the highest stage was 2.7 feet on the 15th.

Killing frosts were general on the 8th and 9th, and widely scattered occurrences on the 19th and 27th. A moderate hail-storm occurred in portions of Essex, Passaic and south Bergen counties on the 23d. The stones measured up to one and one-quarter inches in diameter but no estimate of damage was reported. Another hail storm crossed the State from Gloucester county, across Camden and Burlington to Ocean county on the 29th. In Gloucester county some of the hail was as large as hen eggs and smaller to the eastward down to the size of rice grains at the shore. In Burlington county hail for one hour accumulated and the accumulations remained on the ground in sheltered places for three days. Some fields and cranberry bogs were almost totally damaged. Dense fog occurred on the 10th and 13th. Thunderstorms were reported on the 1st, 5th, 10th, 11th, 15th, 17th, 21st, 22d, 23d, 24th and 29th. Solar halos were observed on the 3d, 4th, 7th, 12th, 13th, 14th and 18th; unar halos on the 3d, 9th and 30th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †† Received too late to be included in the means.

Reference letters, a, b, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc. T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton.

## Daily Precipitation for May, 1925

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXX.

JUNE, 1925.

No. 6

### GENERAL SUMMARY.

The high temperatures of the first week of June will likely remain for a considerable period as the record, with readings averaging some 15 to 17 degrees above normal, away from the immediate coast. In the remainder of the month there were but 5 days with temperatures appreciably subnormal. The monthly State mean temperature, 73.6° exceeds by one degree the previous hottest June, which occurred in 1923, and slightly exceeded the July normal, which is the first time this has been recorded. During this hot week, temperatures were in the 90's or 100's daily. This hot wave was accompanied by a total absence of rain until the 9th when somewhat relieving showers fell in northern counties, but not to the southward. This drought was very damaging to strawberries and greatly shortened growth of garden truck, grass and pasturage. On the 14th showers commenced with marked frequency, which greatly relieved the drought situation, except in a narrow zone from the Somerset-Middlesex county boundary southwestward to the lower Delaware and Delaware Bay. In this restricted area the deficiency of rain exceeded two inches, and was next to the driest June record for the Trenton station. In combination of heat and dryness this month broke all previous June records. In the latter half of the month typically heavy summer thundershowers occurred in various portions of northern counties, and in the extreme northeastern corner of the State the rain slightly exceeded the normal volume.

Storm warnings were displayed along the coast on the 24th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 37 stations, was 73.6°, which was 5.1° above normal. The highest temperature was 103° at Belvidere on the 5th, and the lowest, 36°, at Charlotteburg on the 12th. The greatest daily range of temperature was 54° at Runyon on the 17th. The highest monthly mean temperature was 77.7° at Burlington, and the lowest, 68.5° at Charlotteburg.

The temperature departure from the normal for the year, 1925, to date, by sections, is: The Highlands, +1.8°; Red Sandstone Plain, +1.8°; Southern Interior, +2.9°; Sea Coast, +3.1°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 42 stations, was 3.10 inches, which was 0.64 inch below normal.

The greatest monthly precipitation was 6.16 inches, at Chatham, and the least, 0.72 inch at Trenton. The greatest amount of precipitation in any 24 consecutive hours was 2.42 inches at South Orange on the 25th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 9, or 1 less than normal.

The precipitation accumulated departure from the normal for the year 1925, to date, by sections, is: The Highlands, -0.92 inch; Red Sandstone Plain, -2.48 inches; Southern Interior, -6.33 inches; Sea Coast, -5.90 inches.

### WIND.

The prevailing wind direction was from the southwest. The

wind movement averaged 12 miles per hour, which was normal. The highest velocity, sustained for 5 consecutive minutes, was 66 miles per hour from the northwest at Sandy Hook on the 29th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 17, which was 4 more than normal; partly cloudy, 9, or 1 less than normal; cloudy, 4, or 3 less than normal. The per cent of possible sunshine was 74, which was 13 per cent above normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 1.5 feet, and the highest stage, 2.8 feet on the 1st. At Trenton the mean daily stage was 0.9 foot, which was 1.0 foot below the normal; the highest stage was 1.8 feet on the 1st.

The mean atmospheric pressure, reduced to sea level, was 29.98 inches, which was normal. The highest reading was 30.34 inches at Sandy Hook and Ridgefield on the 12th, and the lowest, 29.57 at Ridgefield on the 18th.

Thunderstorms occurred daily in some portion of the State except on the 3d to the 8th, inclusive, 11th to the 13th, inclusive, 17th, 19th, 23d, 24th and 26th. Dense fog occurred on the 8th and 9th. A lunar halo was observed on the 3d, and a solar halo on the 15th. Light hail with no damage reported fell at Indian Mills on the 9th, Flemington on the 16th, Layton and Highwood on the 20th, and Lambertville and New Brunswick on the 29th.

### COMPARATIVE DATA FOR JUNE

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton.

Daily Precipitation for June, 1925

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXX. JULY, 1925. No. 7

### GENERAL SUMMARY.

The abnormal warmth of June did not continue into July, and on all days except about six it was slightly subnormal. The monthly mean temperature was 1.6° lower than that for June, which is an inversion of infrequent occurrence. Another feature of notable significance was the rain, both as to amount and frequency. Rain in measureable volume fell 3 days oftener than normal, and the mean monthly amount, 7.37 inches, has been exceeded only in 1887, 1889, 1897, and in 1919. Throughout extensive portions of the northern and southern interior rainfall averaged above 8 inches, while in a narrow zone across the State from Mercer County to Sandy Hook it was mostly under 5 inches. While this large volume of rain has finally accumulated an excess of rain over The Highlands for the year, to date, there still remains an appreciable deficiency in the southern interior. The rains being of brief duration, and several occurrences being at night, many usual outdoor pursuits were not unduly interfered with, except in northern counties where the oats harvest was hampered. Sunshine and clear skies slightly exceeded normal, which was unusual when the excess of rain is considered.

Crop growth, which had been seriously harmed by the drought and heat of June, was very considerably revived by the combined circumstances of generous rains and an absence of burning hot days. Wheat, hay, rye, and potatoes were damaged more or less before the advent of rains which might have averted some of the losses which they permanently sustained. There was a fair degree of recovery in other crops.

No storm warnings were displayed along shore during the month.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 36 stations, was 72.0°, which was 1.5° below normal. The highest temperature was 99° at Indian Mills on the 7th, and the lowest, 39°, at Belleplain on the 1st. The greatest daily range of temperature was 41° at Runyon on the 24th. The highest monthly mean temperature was 75.3° at Bridgeton, and the lowest, 67.2° at Charlotteburg.

The temperature departure from the normal for the year, 1925, to date, by sections, is: The Highlands, +1.3°; Red Sandstone Plain, +1.2°; Southern Interior, +2.3°; Sea Coast, +2.6°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 42 stations, was 7.37 inches, which was 2.78 inches above normal.

The greatest monthly precipitation was 10.09 inches, at Belleplain, and the least, 4.03 inches at Runyon. The greatest amount of precipitation in any 24 consecutive hours was 4.33 inches at Chatham on the 31st. The mean of the number of days on which 0.01 inch or more of precipitation fell was 13, or 3 more than normal.

The precipitation accumulated departure from the normal for the year 1925, to date, by sections, is: The Highlands, +2.58 inches; Red Sandstone Plain, —.40 inch; Southern Interior, —2.75 inches; Sea Coast, —4.08 inches.

### WIND.

The prevailing wind direction was from the South. The wind movement averaged 10 miles per hour, which was about normal. The highest velocity sustained for 5 consecutive minutes, was 57 miles per hour from the southeast at Long Branch on the 31st.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 15, which was 2 more than normal; partly cloudy, 9, or 2 less than normal; cloudy, 7, or normal. The per cent of possible sunshine was 67, which was 4 per cent above normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 1.7 feet, and the highest stage was 4.0 feet on the 27th to 31st, inclusive. At Trenton the mean stage was 0.8 foot, which was 0.5 foot below the normal. The highest stage, 2.1 feet, occurred on the 26th and 27th.

The mean atmospheric pressure, reduced to sea level, was 29.95 inches, which was .03 inch below normal. The highest reading was 30.28 inches on the 1st at Cape May City, and the lowest, 29.61 inches on the 16th at Sandy Hook and Trenton.

Thunderstorms occurred on the 2d, 4th, 5th, 7th, 8th, 10th, 12th, 14th to 17th inclusive, 21st, 22d, 25th to 29th inclusive, and 31st. Dense fog was observed on the 6th, 7th, 8th, and 10th. A solar halo was observed on the 1st. Light hail causing very little damage fell on the 16th at Culvers Lake. A heavy windstorm at Riverside on the 16th, caused considerable damage.

### COMPARATIVE DATA FOR JULY

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Ridgefield is Morsemere.

## Daily Precipitation for July, 1925

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXX.

AUGUST, 1925.

No. 8

### GENERAL SUMMARY.

During the first half of the month several dry days followed the abrupt termination of the frequent rains of July. Showers, which were frequent but not voluminous, occurred during the remainder of the first fortnight. The drought during the latter half of the month was broken only by rains on the 20th and 21st. Moderate crop deterioration resulted. The absence of severely warm days, and the prevalence of cool mornings, made August unusually comfortable in contrast to the humidity and heat usually characteristic of this month. Natural water courses, which had been fully restored in July, again became low toward the close of August, with resulting inconvenience.

No storm warnings were displayed along the shore during the month.

E. M. B.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 33 stations, was 71.0°, which was 0.9° below normal. The highest temperature was 93° at 9 stations on the 20th, 26th, and 31st, and the lowest, 35°, at Charlotteburg and Layton on the 28th. The greatest daily range of temperature was 46° at Belleplain on the 30th. The highest monthly mean temperature was 73.4° at Vineland, and the lowest, 66.6° at Charlotteburg.

The temperature departure from the normal for the year 1925, to date, by sections, is: The Highlands, +1.1°; Red Sandstone Plain, +0.9°; Southern Interior, +1.8°; Sea Coast, +2.3°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 38 stations, was 2.10 inches, which was 2.71 inches below normal. The greatest monthly precipitation was 4.12 inches at Belleplain, and the least, 0.94 inch at Belvidere. The greatest amount of precipitation in any 24 consecutive hours was 3.37 inches at Belleplain on the 5th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 7 or 3 less than normal.

The precipitation accumulated departure from the normal for the year 1925, to date, by sections, is: The Highlands, +0.28 inch; Red Sandstone Plain, -3.39 inches; Southern Interior, -5.43 inches; Sea Coast, -6.56 inches.

### WIND.

The prevailing wind direction was from the west. The wind movement averaged 9 miles per hour, which was normal. The highest velocity, sustained for 5 consecutive minutes, was 40

miles per hour from the northeast at Atlantic City on the 27th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 20, which was 7 more than normal; partly cloudy, 6, or 5 less than normal; cloudy, 5, or 2 less than normal. The per cent of possible sunshine was 77, which was 11 per cent above normal.

### MISCELLANEOUS.

The mean atmospheric pressure reduced to sea level, was 30.08 inches, which was 0.08 inch above normal. The highest reading was 30.49 inches at Cape May City on the 24th, and the lowest 29.70 inches at Sandy Hook on the 1st.

The mean stage of the Delaware River at Phillipsburg was 2.1 feet; and the highest stage 4.1 feet on the 3d. At Trenton the mean daily stage was 1.2 feet, which was 0.1 foot above normal. The highest stage was 2.3 feet on the 2d.

Thunderstorms occurred in some portions of the State on the 4th, 5th, 6th, 8th, 9th, 10th, 11th, 14th, 20th, and 31st. Dense fog was noted on the 7th, 14th, and 19th. Solar halos were observed on the 3d, 8th, 12th, and 28th, and lunar halos on the 31st.

Hail fell, with no damage at Ridgefield on the 11th, and with appreciable damage at Franklin Park on the 31st.

### COMPARATIVE DATA FOR AUGUST

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Ridgefield is Morsemere.

## Daily Precipitation for August, 1925

# CLIMATOLOGICAL DATA.

NEW JERSEY SECTION. OCT 29 1925

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXX.

SEPTEMBER, 1925.

No. 9

## GENERAL SUMMARY.

The first three weeks of September was mostly above normal in warmth, and this was followed by a change to decidedly cooler weather, and frosts were commonly experienced on the 23d and 26th. Clear weather which is a usual feature of September was somewhat deficient, and much more northerly and northwesterly winds prevailed than is normally the case. The occurrences of rain were somewhat irregularly scattered both as to time and location except for one notably rainy period from the 14th to the 17th inclusive, when nearly all the rain of the month fell. At Trenton on the 16th the fall of rain for the 10 minutes commencing 10:31 p. m. amounted to 0.94 inch. Practically no rain fell after the 17th. The deficiency of precipitation for the year throughout the State is steadily increasing, being more marked in the southern half than in the northern.

Nearly all crop progress was practically terminated by the close of the month, and the bulk of commercial production was housed or protected from possible extreme weather damage.

Storm warnings were displayed along the northern coast on the 20th.

## TEMPERATURE.

The monthly mean temperature for the State, as deduced from observations of 33 stations, was 67.8°, which was 2.1° above normal. The highest temperature was 96° at Phillipsburg on the 13th, and the lowest, 25°, at Charlotteburg on the 26th. The greatest daily range of temperature was 48° at Sussex on the 1st. The highest monthly mean temperature was 73.1° at Vineland, and the lowest, 63.4° at Charlotteburg and Layton.

The temperature departure for the normal for the year, 1925, to date, by sections, is: The Highlands, +1.1°; Red Sandstone Plain, +1.0°; Southern Interior, +2.0°; Sea Coast, +2.3°.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 40 stations, was 2.92 inches, which was 0.71 inch below normal. The greatest monthly precipitation was 5.81 inches, at Belvidere, and the least, 0.64 inch at Vineland.

The greatest amount of precipitation in any 24 consecutive hours was 2.72 inches at Indian Mills on the 3d. The mean of the number of days on which 0.01 inch or more of precipitation fell was 7, or 1 less than normal.

The precipitation accumulated departure from the normal for the year 1925, to date, by sections, is: The Highlands, +0.18 inch; Red Sandstone Plain, -3.73 inches; Southern Interior, -6.74 inches; Sea Coast, -7.99 inches.

## WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 11 miles per hour, which was 1 mile below normal. The highest velocity, sustained for 5 consecutive

minutes, was 45 miles per hour from the north at Sandy Hook on the 21st.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 11, which was 4 less than normal; partly cloudy, 11, or 3 more than normal; cloudy, 8, or 1 more than normal. The per cent of possible sunshine was 65, which was 3 per cent below normal.

## MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.04 inches, which was 0.03 inch below normal. The highest reading was 30.56 inches at Ridgefield on the 26th, and the lowest, 29.69 inches at Sandy Hook on the 21st.

The mean stage of the Delaware River at Phillipsburg was 1.8 feet, and the highest 4.9 feet on the 16th. At Trenton the mean stage was 0.9 foot, which was 0.2 foot below the normal. The highest stage, 3.3 feet, occurred on the 16th.

Thunderstorms occurred on the 1st, 3d, 4th, 12th to 18th, inclusive, 21st and 28th. Dense fog occurred on the 4th, 11th and 12th. Solar halos were observed on the 1st, 2d, 8th, 16th, 18th and 19th and lunar halos on the 2d, 5th, 21st and 30th. Auroras were observed at Layton on the 15th and 21st. Frosts occurred over the northern half of the State on the 23d being killing in extreme northwestern counties and diminishing gradually toward the south. On the 26th, light to heavy frost was general in all portions of the State except along the shore and Delaware Bay.

## COMPARATIVE DATA FOR SEPTEMBER

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Ridgefield is Morsemere.

## Daily Precipitation for September, 1925

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXX.

OCTOBER, 1925.

No. 10

### GENERAL SUMMARY.

The weather of October, 1925, in New Jersey, will go into the records as being the stormiest since the systematic compilation of data. The only approximately normal element was the amount of precipitation, and that was somewhat in excess. Sunshine was deficient, cloudiness and wind were excessive, the mean monthly temperature for the entire State was the lowest on record, and in many localities new low temperature extremes occurred. To produce a sensational climax to what was already a notable month, snow fell practically throughout the State on the 30th from morning to early night, amounting from a trace up to five inches. The 31st dawned showing trees and shrubs in full foliage draped under a spectacular snow covering. Snowshovels and children's sleds were in use. This snowstorm probably exceeds all October records back to that of 1859. In northwestern counties there was sufficient snow on the 22d to arouse comment.

On the 10th a severe wind storm caused considerable damage especially over the northern half of the State. Insecure structures were wrecked, plate glass windows broken, and branches broken from shrubbery and trees. A live electric wire blown down by the wind caused one death in South Orange.

On the 25th a second severe wind storm caused general damage over the southern half and coast sections. This accompanied a typical cyclonic low pressure area, and many buildings of apparently substantial construction were seriously damaged or even totally wrecked. The wind velocity during the daylight hours was above 50 and into the upper 60's in miles per hour for a long period, and farm buildings, shore cottages and wires were hard hit. A child was killed in Little Falls when the wind toppled a brick wall upon her.

Storm warnings were displayed along the coast on the 9th, 10th, 14th, 16th, 19th, 24th, 25th, 28th, and 30th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 34 stations, was 49.1°, which was 5.9° below normal. The highest temperature was 84° at Tuckerton on the 17th, and the lowest, 12°, at Layton on the 31st. The greatest daily range of temperature was 41° at Charlotteburg on the 1st. The highest monthly mean temperature was 53.8° at Cape May City, and the lowest 44.3° at Layton.

The temperature departure from the normal for the year, 1925, to date, by sections, is: The Highlands, +0.4°; Red Sandstone Plain, +0.3°; Southern Interior, +1.2°; Sea Coast, +1.5°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 39 stations, was 4.59 inches, which was 0.90 inch above normal. The average total snowfall at eighteen selected stations was 1.7 inches, which was 1.7 inches above normal. The greatest monthly precipitation was 5.78 inches, at South Orange, and the least, 3.38 inches at Northfield. The greatest amount of precipitation in any 24 consecutive hours 2.10 inches at Elizabeth on the 24-25th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 11, or 3 more than normal.

The precipitation accumulated departure from the normal for the year 1925, to date, by sections, is: The Highlands, +0.86 inch; Red Sandstone Plain, -2.65 inches; Southern Interior, -5.86 inches; Sea Coast, -7.31 inches.

### WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 14 miles per hour, which was 2 miles above normal. The highest velocity, sustained for 5 consecutive minutes, was 68 miles per hour from the northwest at Sandy Hook on the 10th, and 68 miles per hour from the south at Atlantic City on the 25th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 9, which was 6 less than normal; partly cloudy, 9, or 1 more than normal; cloudy, 13, or 5 more than normal. The per cent of possible sunshine was 45, which was 18 per cent below normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.00 inches, which was 0.07 below normal. The highest reading was 30.51 inches at Ridgefield on the 31st, and the lowest, 29.03 inches at Sandy Hook on the 25th.

The mean stage of the Delaware River at Phillipsburg was 1.7 feet, and the highest stage, 5.5 feet, on the 27th. At Trenton the mean stage was 0.9 foot, which was 0.5 foot below normal. The highest stage, 3.1 feet, occurred on the 28th.

Thunderstorms occurred on the 4th, 5th, 16th, 17th and 28th. Dense fog was observed on the 25th. Solar halos were observed on the 3d, 4th, 6th, 11th, 16th, 18th, 26th, 27th and 28th and lunar halos on the 27th. An aurora occurred on the 13th. Killing frosts occurred in extreme northern counties in September. They overspread north-central and northeastern districts on October 1st, the entire Delaware Valley on the 11th, the south-central interior on the 20th, and the sea coast at the close of the month.

### COMPARATIVE DATA FOR OCTOBER

| Year      | Temperature |         |        | Precipitation |          |       | No of days |               |        |                        |

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Ridgefield is Morsemere

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXX.

NOVEMBER, 1925.

No. 11

### GENERAL SUMMARY.

General weather conditions during November were more nearly typical of the last of the autumn months than have prevailed during the past few years, although exception must be made of the most severe cold wave on record in November of last year. The amounts of sunshine, snow and warmth were slightly deficient, and high winds and rain were slightly in excess of normal. Nearly all the precipitation occurred in the first 16 days, there being but two moderate rains thereafter. Periods of cold and warm weather alternated with some regularity, lasting some 4 or 5 days consecutively.

The most noteworthy feature of the month was the high winds which immediately preceded and followed the unusually low pressure which passed over this section on the 13th, moving from the southwest to northeast. Considerable damage was caused in all parts of the State by minor injuries to insecure structures and branches of trees. The heaviest rain of the month attended this storm, in nearly all localities amounts exceeded an inch in 24 hours. Along shore gales occurred on ten or more days, and in the interior of the State the wind equalled or exceeded the rate of 40 miles per hour at least once per day on the 5 consecutive days starting with the 13th.

Storm warnings were displayed along the coast on the 3d, 5th, 7th, from the 12th to 17th inclusive, 21st and 27th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 32 stations, was 42.0°, which was 1.1° below normal. The highest temperature was 76° at Vineland on the 15th, and the lowest, 10°, at Charlotteburg on the 1st. The greatest daily range of temperature was 43° at Belleplain on the 15th. The highest monthly mean temperature was 45.8° at Cape May City, and the lowest, 37.8° at Layton.

The temperature departure from the normal for the year, 1925, to date, by sections, is; The Highlands, +0.2°; Red Sandstone Plain, +0.1°; Southern Interior, +1.1°; Sea Coast, +1.3°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 37 stations, was 3.40 inches, which was 0.33 inch above normal. The average total snowfall at eighteen selected stations was 0.7 inch, which was 0.5 inch below normal. The greatest monthly precipitation was 5.10 inches, at Dover, and the least, 2.48 inches at New Brunswick. The greatest amount of precipitation in any 24 consecutive hours was 2.86 inches at Charlotteburg on the 12-13th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 9, or 1 more than normal.

The precipitation accumulated departure from the normal for the year 1925, to date, by sections, is: The Highlands, +1.62 inches; Red Sandstone Plain, -2.32 inches; Southern Interior, -5.52 inches; Sea Coast, -7.65 inches.

DEC 28 1925

### WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 16 miles per hour, which was 2 miles above normal. The highest velocity, sustained for 5 consecutive minutes, was 68 miles per hour from the south at Sandy Hook on the 16th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 14, which was 2 more than normal; partly cloudy, 8, or normal; cloudy, 8, or 2 less than normal.

The per cent of possible sunshine was 53, which was 5 per cent below normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 5.2 feet, and the highest stage, 10.0 feet on the 17th. At Trenton the mean daily stage was 2.8 feet, which was 1.0 foot above normal. The highest stage was 5.6 feet on the 18th.

The mean atmospheric pressure, reduced to sea level, was 30.14, which was 0.04 inch above normal. The highest reading was 30.67 at Sandy Hook on the 4th, and the lowest, 29.16 at Ridgefield on the 13th.

Dense fog was observed on the 27th. Solar halos were noted on the 5th and 25th, and lunar halos on the 1st, 4th, 6th, 26th, and 29th. Auroras were observed on the 8th and 9th.

### COMPARATIVE DATA FOR NOVEMBER

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc. T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Ridgefield is Morsemere.

## Daily Precipitation for November, 1925

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXX.

DECEMBER, 1925.

No. 12

### GENERAL SUMMARY.

The one outstanding weather event of December was the occurrence of a tropical storm which moved from the southern coast of the Atlantic seaboard to a position off the New Jersey shore on the afternoon of the 3d. Gales driving long continued rain did considerable damage along the water front of the entire Jersey coast. Bulkheads, board walks, and other structures were washed out or otherwise seriously damaged by the combined forces of wind and wave. Great holes were washed in some of the noted resort beaches, and great combers in some instances overtopped the barriers and swept into town and building. Some lives were lost due to the storm, and there was considerable loss and delay to navigation.

Nearly all of the rain, and excess of warmth, were due to the storm. There were several snow flurries of no importance, the greatest amount being on the 16th in extreme northern counties.

The closing week of the year averaged nearly ten degrees colder than normal, but the extremes of cold on the 26th, 27th, and 28th, were not remarkable. During this cold period streams and ponds became ice-bound, but the ice was not thick enough for commercial harvest.

Weather conditions as a whole, the lack of snow and of severe cold, the generous sunshine except during the first five days, all combined in making December a month of generally pleasant weather.

The year closed with a slight excess of warmth and deficiency of precipitation.

Storm warnings were displayed along the coast from the 1st to 3d, 5th, 8th, 12th, 19th, 22d, 25th, and 27th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 33 stations, was 34.0°, which was 1.0° above normal. The highest temperature was 61° at Bridgeton and Runyon on the 6th, and the lowest, -5°, at Culvers Lake on the 27th. The greatest daily range of temperature was 32° at Belleplain and Pleasantville on the 19th and at Indian Mills on the 8th. The highest monthly mean temperature was 37.8° at Cape May City, and the lowest, 30.2° at Charlotteburg and Layton.

The temperature departure from the normal for the year, 1925, to date, by sections, is: The Highlands, +0.4°; Red Sandstone Plain, +0.2°; Southern Interior, +1.0°; Sea Coast, +1.2°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 41 stations, was 2.84 inches, which was 1.13 inches below normal. The average total snowfall at eighteen selected stations was 0.6 inch, which was 5.5 inches below normal. The greatest monthly precipitation was 4.58 inches, at Lakewood, and the least, 1.08 inches at Moorestown. The greatest amount of precipitation in any 24 consecutive hours was 2.55 inches at Lakewood on the 3d. The mean of the number of days on which 0.01 inch or more of precipitation fell was 10, or 1 more than normal.

The precipitation accumulated departure from the normal for the year 1925, to date, by sections, is: The Highlands,

+0.58 inch; Red Sandstone Plain, -3.23 inches; Southern Interior, -7.04 inches; Sea Coast, -8.61 inches.

### WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 17 miles per hour, which was 3 miles above normal. The highest velocity, sustained for 5 consecutive minutes, was 70 miles per hour from the northeast at Atlantic City on the 2d.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 13, which was 1 more than normal; partly cloudy, 7, or 2 less than normal; cloudy, 11, or 1 more than normal. The per cent of possible sunshine was 50, which was 2 per cent below normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 29.94 inches, which was 0.16 inch below normal. The highest reading was 30.50 inches at Cape May City on the 30th, and the lowest, 29.40 inches at Sandy Hook on the 12th.

The mean stage of the Delaware River at Phillipsburg was 5.0 feet, and the highest stage, 9.5 feet on the 6th. At Trenton the mean daily stage was 2.7 feet, which was 0.1 foot above normal. The highest stage was 5.4 feet on the 7th.

Thunder was heard at several northern stations attendant upon the storm of the 5th. Dense fog was observed on the 4th, 5th, 21st and 22d. Solar halos were observed on the 6th, 15th, and 19th and lunar halos on the 23d and 24th. Sleet fell on 9th, 15th and 16th.

### COMPARATIVE DATA FOR DECEMBER

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Ridgefield is Morsemere

# CLIMATOLOGICAL DATA.

NEW JERSEY SECTION,  
G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXX.

ANNUAL SUMMARY, 1925. *RECAP OF* No. 13

## GENERAL SUMMARY.

The two principal weather factors, temperature and precipitation, show that the year 1925 was warm and dry in New Jersey. The three warm months of February, March and June were not equally offset by subnormal warmth in October. February was almost as warm as the normal for March, and October was colder than the normal for April. The February warmth caused freshets in some of the rivers in northern parts of the State with considerable resulting damage. A cold wave in early March afforded an opportunity for some late ice harvest, which is quite unusual for the season. June was the warmest month of the year, another unusual feature, as it is normally warmer in both July and August.

January, July, October, and November produced the only surplus precipitation, which was slight, and this was substantially diminished in other months to a deficiency for the year.

A snowstorm at the close of October was remarkable for its early occurrence, and records have to be searched back to 1860 and 1859 for anything similar. Snow covered foliage on shrubs and trees was an unfamiliar sight, and children's sleds were brought out and put into use.

The past 20 years has shown an accumulated lack of precipitation throughout the State of 90 and more inches, from that of the preceding twenty-year period. While this has no climatic significance, it is an important fact to be considered in engineering investigations of stream flow, ground water levels and water supply. With increasing population and consequent increase in use of water, the deficiency in precipitation is more apparent than real.

The mean temperature for the year, 52.1°, was 0.4° above normal. The warmest month was June, 73.6°, and the coldest, January, 27.4°. The highest temperature was 103° at Belvidere on June 5th, and the lowest, 20° below zero at Layton on January 28th. The highest mean temperature was 55.0° at Cape May City, and the lowest, 48.1° at Charlotteburg. The greatest annual range of temperature was 119° at Layton.

The average precipitation for the State for the year was 42.15 inches, which was 4.39 inches below normal. The greatest monthly average was 7.37 inches in July, and the least, 2.10 inches in August. The greatest monthly amount of precipitation was 10.09 inches at Belleplain in July, and the least, 0.49 inch at Cape May City in May. The greatest annual precipitation was 54.24 inches at Belvidere, and the least, 33.16 inches at Cape May City.

The average snowfall for the State was 25.4 inches, which was 5.4 inches below normal. The greatest annual snowfall was 55.6 inches at Belvidere, and the least, 3.9 inches at Northfield.

The average number of days on which 0.01 inch or more precipitation occurred was 111, which was 3 less than normal. The average number of clear days was 165, which was 17 more than normal; partly cloudy, 97, which was 13 less than normal; cloudy, 103, which was 4 less than normal.

The prevailing wind direction was from the northwest; the highest velocity was 78 miles per hour from the northeast at Atlantic City on January 2d.

A moderate hail storm occurred in portions of Essex, Passaic and south Bergen counties on May 23d. Another hail storm moved over the State from Gloucester county, across Camden and Burlington to Ocean county on May 29th. Some fields and

cranberry bogs were almost a total loss. Appreciable damage by hail occurred at Franklin Park on August 31st. A heavy wind storm at Riverside on July 16th, caused considerable injury. Light hail with no damage fell at various stations on June 9th, 16th, 20th, 29th, July 16th, and August 11th.

## COMPARATIVE ANNUAL DATA FOR THE STATE

| Year | Temperature |         |        | Average precipitation | Year | Temperature |         |        | Average precipitation |
|------|-------------|---------|--------|-----------------------|------|-------------|---------|--------|-----------------------|
|      | Mean        | Highest | Lowest |                       |      | Mean        | Highest | Lowest |                       |

VOL. XXXI.

JANUARY, 1926.

No. 1

### GENERAL SUMMARY.

For the mid-winter month the weather of January was more than ordinarily pleasant. There was but little rain and snow, and there was about a normal amount of sunshine. Two cold periods prevailed, one from the 8th to the 14th, and the other from the 23d to the 29th. On the coldest day, the 29th, the minima were below zero only in the northernmost portions of the State. This low temperature was sufficient to keep ponds closed with ice, but the Delaware River was open from the 19th to the 27th when it again closed. The first and third weeks were slightly warmer than normal and this more than offset the cold periods so that the month as a whole afforded a slight excess in warmth.

A light snowstorm on the 9th measured some two inches in northern portions, and progressively less to the southward where there was no more than trace; this snow remained on the ground several days before vanishing. Another snow of lighter volume set in on the afternoon of the 27th and continued to the forenoon of the 28th when it reacted to clearing and was attended by northwesterly gales all day. This, in turn, was followed by the cold wave of the 27-28th, when the coldest weather of the month occurred. Other cold waves on the 13th and 22d were not important. Storm warnings were displayed along the coast on the 8th, 18th, from the 21st to 24th, 28th and 31st.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 36 stations, was 30.8°, which was 0.6° above normal. The highest temperature was 63° at Pleasantville and Vineland on the 20th, and the lowest, 9° below zero, at Newton on the 29th. The greatest daily range of temperature was 42° at Layton on the 11th, and at Charlotteburg on the 17th. The highest monthly mean temperature was 34.6° at Cape May City, and the lowest, 26.0° at Layton.

The temperature departure from the normal for the year 1926, to date, by sections, is: The Highlands, +1.3°; Red Sandstone Plain, +0.4°; Southern Interior, +0.3°; Sea Coast, +1.0°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 42 stations, was 2.61 inches, which was 1.04 inches below normal. The average total snowfall at eighteen selected stations was 2.4 inches, which was 5.0 inches below normal. The greatest monthly precipitation was 4.04 inches at Highwood, and the least, 1.63 inches at Boonton. The greatest amount of precipitation in any 24 consecutive hours was 1.98 inches at Highwood on the 17-18th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 9, or 1 less than normal.

The precipitation accumulated departure from the normal for the year 1926, to date, by sections, is: The Highlands, -1.44 inches; Red Sandstone Plain, -1.30 inches; Southern Interior, -0.74 inch; Sea Coast, -0.80 inch.

### WIND.

The prevailing wind direction was from the southwest. The wind movement averaged 15 miles per hour, which was 1 mile above normal. The highest velocity, sustained for 5 consecutive minutes, was 72 miles per hour from the east at Atlantic City on the 9th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 11, which was normal; partly cloudy, 8, or 1 less than normal, cloudy, 12, or 1 more than normal. The per cent of possible sunshine was 51, which was 1 per cent above normal.

### MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.04 inches, which was 0.07 inch below normal. The highest reading was 30.56 inches at Cape May City on the 29th, and the lowest, 29.31 inches at Sandy Hook on the 18th.

The mean of the Delaware river at Phillipsburg was 3.8 feet for 21 days. The highest stage was 6.0 feet on the 19th. At Trenton the river was frozen most of the month.

Dense fog occurred on the 4th, 5th, 6th, 9th, 18th and 21st. Thunder was heard at three stations on the 18th. Sleet fell on the 8th, 9th, 22d, and 28th. Solar halos were observed on the 1st, 13th, 17th, 27th, and 30th; and lunar halos on the 19th, 20th, 26th, 28th, 29th and 30th.

### COMPARATIVE DATA FOR JANUARY

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Ridgefield is Morsemere

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXXI.

FEBRUARY, 1926.

No. 2

### GENERAL SUMMARY.

Stormy weather prevailed in February to a considerable extent, although there were no severe extremes. Gale, snowfall, total precipitation, and cloudiness exceeded normal, and slightly subnormal temperature prevailed. Since average snowfall for the State has been tabulated in 1895, the snowfall this month had been exceeded only in February 1899, and closely equalled in December 1904, January 1905, February 1907 and 1920, and January 1925. The snowiest winter on record was 1898-1899, with 59 inches, and the next was 1904-1905, with 54 inches. The snow of February 1926 occurred mostly on the 3d-4th in northern counties, and on the 9-10th in central and southern districts. Both these storms caused considerable interference with highway traffic and delayed rail traffic somewhat, the greatest trouble being caused by gales drifting the snow back over routes which had been cleared. Two thunderstorms and hail were notably unusual features to occur in winter. The depth of snow averaged in excess of 20 inches over the northern half of the State, and from 5 to 20 inches in the southern half.

Temperatures were subnormal over central and northeastern portions of the State, and slightly above normal elsewhere. The coldest days were about 16° below normal, and the warmest about 12° above normal, otherwise temperature conditions were without remark.

The Delaware River was mostly open after the 20th, although there was considerable ice bound to the shore.

Storm warnings were displayed along the coast on the 1st, 3d, 4th, 9th, 10th, 14th, 19th, and 25th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 39 stations, was 29.4°, which was 0.2° below normal. The highest temperature was 57° at Belleplain on the 18th, and the lowest, 11° below zero, at Layton on the 9th. The greatest daily range of temperature was 42° at Runyon on the 17th. The highest monthly mean temperature was 34.8° at Cape May City, and the lowest, 24.4° at Layton.

The temperature departure from the normal for the year 1926, to date, by sections, is: The Highlands, +0.9°; Red Sandstone Plain, -0.2°; Southern Interior, +0.4°; Sea Coast, +0.4°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 40 stations, was 4.54 inches, which was 0.84 inch above normal. The average total snowfall at eighteen selected stations was 21.2 inches, which was 14.6 inches above normal. The greatest monthly precipitation was 6.30 inches, at South Orange, and the least, 2.86 inches at Cape May City. The greatest amount of precipitation in any 24 consecutive hours was 2.70 inches at Charlotteburg on the 3d-4th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 11, or 2 more than normal.

The precipitation accumulated departure from the normal for the year 1926, to date, by sections, is: The Highlands, +0.19 inch; Red Sandstone Plain, -0.10 inch; Southern Interior, -0.38 inch; Sea Coast, -0.60 inch.

### WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 17 miles per hour, which was 3 miles above normal. The highest velocity, sustained for 5 consecutive minutes, was 78 miles per hour from the northeast at Atlantic City on the 4th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 9, which was 2 less than normal; partly cloudy, 5, or 3 less than normal; cloudy, 14, or 5 more than normal. The per cent of possible sunshine was 48, which was 8 per cent below normal.

### MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 29.89 inches, which was 0.21 inch below normal. The highest reading was 30.49 inches at Cape May City on the 17th, and the lowest, 29.17 inches at Atlantic City on the 19th.

The Delaware River remained frozen the greater part of the month at Phillipsburg and Trenton. Sleet fell on the 1st, 3d, 4th, 13th, and 19th. Dense fog occurred on the 1st, 14th, 19th, and 25th. Solar halos were observed on the 6th, 18th, 27th, and lunar halos on the 3d, 21st, and 22d. Thunderstorms occurred on the 14th and 25th.

Light hail fell generally over the northern half of the State in connection with the thunderstorm of the 25th, and also at New Brunswick and South Orange on the 14th.

### COMPARATIVE DATA FOR FEBRUARY

| Year | Temperature |         |        | Precipitation |          |       |          | No. of days |               |        |                        |

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc. T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Ridgefield is Morsemere.

## Daily Precipitation for February, 1926

CHARLES F. MARVIN, Chief.

APR 30 1926

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXXI.

MARCH, 1926.

No. 3

### GENERAL SUMMARY.

The most significant features of March weather were the unusual amount of sunshine and clear sky, and the prevailing low temperatures. It was the coldest March in ten years, and was in marked contrast with that of last year, and especially with that of 1921, which was 14° warmer. In spite of the persistent low temperatures the month was much more pleasant than March ordinarily is, because of the infrequency of stormy weather and the absence of snow. Except on the 1st and 7th, warmth was persistently subnormal until the week of the 19-25th, which was warm, terminating with temperatures well up in the 70's, but thereafter it was cold with continuous frosts and freezing temperatures. Snow on the 8th and 26th hardly averaged 2 inches in northernmost localities, and was but a trace along shore. The few occurrences of sleet were unimportant.

This uniform cold weather retarded the opening of usual spring activities out of doors and many forms of farming and construction work were delayed. Vegetation remained in almost complete dormancy, and general agricultural conditions were some three weeks or more behind that of last year.

Storm warnings were displayed along shore on the 1st, 2d, 3d, 7th, 8th, 25th, 26th, 30th, and 31st.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 37 stations, was 35.1°, which was 3.5° below normal. The highest temperature was 79° at Tuckerton on the 25th, and the lowest, zero, at Layton on the 6th. The greatest daily range of temperature was 48° at Runyon on the 22d. The highest monthly mean temperature was 38.9° at Vineland, and the lowest, 31.0° at Charlotteburg and Layton.

The temperature departure from the normal for the year 1926, to date, by sections, is: The Highlands, -0.7°; Red Sandstone Plain, -1.3°; Southern Interior, -0.9°; Sea Coast, -0.5°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 45 stations, was 2.25 inches, which was 1.67 inches below normal. The average total snowfall at eighteen selected stations was 0.4 inch, which was 5.3 inches below normal. The greatest monthly precipitation was 3.15 inches, at South Orange, and the least, 1.52 inches at Cape May City. The greatest amount of precipitation in any 24 consecutive hours was 1.95 inches at South Orange on the 7-8th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 7, or 4 less than normal.

The precipitation accumulated departure from the normal for the year 1926, to date, by sections, is: The Highlands, -1.48 inches; Red Sandstone Plain, -1.68 inches; Southern Interior, -1.87 inches; Sea Coast, -2.52 inches.

### WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 15 miles per hour, which was normal. The highest velocity, sustained for 5 consecutive minutes, was 68 miles per hour from the east at Atlantic City on the 31st.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 16, which was 4 more than normal; partly cloudy, 9, or normal; cloudy, 6, or 4 less than normal. The per cent of possible sunshine was 67, which was 6 per cent above normal.

### MISCELLANEOUS.

The mean stage of the Delaware river at Phillipsburg was 5.4 feet, and the highest 8.0 feet on the 21st. At Trenton the mean daily stage was 3.2 feet, which was 0.9 foot below normal. The highest stage was 5.0 feet on the 27th.

The mean atmospheric pressure, reduced to sea level, was 29.95 inches, which was 0.06 inch below normal. The highest reading was 30.63 inches at Trenton and Verona on the 6th, and the lowest, 29.25 inches at Atlantic City on the 31st.

Dense fog was reported on the 7th, 20th, and 31st. Sleet occurred on the 7th, 26th, and 31st. Thunderstorms were recorded on the 7th, 18th, 20th, and 31st. Solar halos were observed on the 11th and 20th and a lunar halo on the 22d. The aurora was observed on the 9th. No hail was reported.

### COMPARATIVE DATA FOR MARCH

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Ridgefield is Morsemere

## Daily Precipitation for March, 1926

# CLIMATOLOGICAL DATA.

NEW JERSEY SECTION.  
G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXXI. APRIL, 1926. No. 4

## GENERAL SUMMARY.

The persistent low temperatures which were a feature of the weather of March, continued throughout the greater portion of April, with a result that the mean temperature of the State, 46.4°, was the lowest April mean on record except that of 1907, when it was 45.2°. March was 3.5° below normal, and April 3.0° below normal, so that the accumulation of deficiency in warmth was very considerable. The low temperatures and deficiency in rainfall in both months contributed to a very late dormancy of vegetation, so that the cold had no injurious effect, other than that of delay to spring growth, and prolonged use of artificial heat. The weather was more than ordinarily advantageous for outside work, and soil moisture decreased very rapidly. Practically the only warm periods during the month were the 9th, 10th, 21st, 22d, 23d and 24th. Freezing occurred on an average of about 6 to 8 days throughout the State, away from the immediate coast, and killing frost was reported on 9 days, the last being on the 27th in the northernmost counties. These frost occurrences were no later than normal. In the general march of increasing warmth there were but few retrograde periods so that agricultural progress was practically uninterrupted. The temperature deficiency was very uniform throughout the State, except that it was just about normal along the extreme southeastern coast. The deficiency in precipitation was also very uniformly distributed. It was doubtless a fortunate combination of the elements that there was no excess of rain with the deficiency of heat, or that there was no excess of heat with the lack of rain.

Storm warnings were displayed along the coast on the 3d, 13th, 15th, 24th, 27th and 28th.

## TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 39 stations, was 46.4°, which was 3.0° below normal. The highest temperature was 87° at Pleasantville on the 22d, and the lowest, 14° at Runyon on the 16th. The greatest daily range of temperature was 52° at Layton on the 21st. The highest monthly mean temperature was 50.3° at Vineland, and the lowest, 42.4° at Charlotteburg.

The temperature departure from the normal for the year 1926, to date, by sections, is: The Highlands, -1.6°; Red Sandstone Plain, -1.9°; Southern Interior, -1.3°; Sea Coast, -0.5°.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 43 stations, was 2.05 inches, which was 1.58 inches below normal. The snowfall was a Trace, which was 1.5 inches below normal. The greatest monthly precipitation was 2.97 inches, at Indian Mills, and the least, 1.39 inches at Plainfield. The greatest amount of precipitation in any 24 consecutive hours was 1.16 inches at Burlington on the 24-25th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 8, or 2 less than normal.

The precipitation accumulated departure from the normal for the year 1926, to date, by sections, is: The Highlands, -3.17 inches; Red Sandstone Plain, -3.52 inches; Southern Interior, -3.17 inches; Sea Coast, -3.97 inches.

## WIND.

The prevailing wind direction was from the northwest. The

wind movement averaged 15 miles per hour, which was 2 miles above normal. The highest velocity, sustained for 5 consecutive minutes, was 50 miles per hour from the southeast at Atlantic City on the 3d.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 13, which was 1 more than normal; partly cloudy, 10, or 1 more than normal; cloudy, 7, or 2 less than normal. The per cent of possible sunshine was 66, which was 9 per cent above normal.

## MISCELLANEOUS.

The mean stage of the Delaware river at Phillipsburg was 5.9 feet, and the highest 11.5 feet on the 10th. At Trenton the mean stage was 3.4 feet, which was 0.5 foot below normal, the highest stage was 6.2 feet on the 10th.

The mean atmospheric pressure, reduced to sea level, was 29.96 inches, which was 0.04 inch below normal. The highest reading was 30.32 inches at Atlantic City and Sandy Hook on the 10th and 13th, respectively, and the lowest, 29.40 inches at Sandy Hook on the 1st.

Dense fog was reported on the 8th. Solar halos were observed on the 6th, 12th, and 30th, and a lunar halo on the 21st. Thunderstorms occurred on the 3d, 7th, and 14th. The aurora was observed on the 14th, 15th, 16th, and 25th. Killing frosts continued through the month as late as the 27th.

Light to moderately heavy hail fell generally over the State on the 3d but no material damage resulted. In several localities hail remained on the ground more than eighteen hours. Bridgeton also reported light hail with no damage on the 24th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton.

Daily Precipitation for April, 1926

U. S. DEPARTMENT OF AGRICULTURE WEATHER BUREAU.  
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXXI.

MAY, 1926.

No. 5

GENERAL SUMMARY.

The persistence of the cold weather of April appeared to follow well through May, although the deficiency in warmth was much less pronounced. Taking April and May together there were almost twice as many days with subnormal temperature than there were days of normal or greater warmth. In a small area of the southwestern counties May temperatures were slightly above normal. A further significant feature was the continuous subnormal temperature during the last decade, when ordinarily forerunners of summer warmth might have been occasionally expected. In spite of the general feeling that May was a remarkably cool month, it was warmer than the last two Mays, just the same as May in 1923, and warmer than May 1920 and 1917, the latter being the coolest May on record. In 1918, 1919, 1921 and 1922 it was warmer than this year.

Rain was deficient over practically all portions of the State except the eastern shore, where it was slightly above normal. This lack of rain with the low temperatures probably prevented what might otherwise have been very unfavorable weather for agriculture, and especially unfavorable for seed germination. But crop advances were practically normal as to quality, but some two weeks or more late, as to time.

Sunshine exceeded its normal by some 15 percent. of possible, and this, with a deficiency of rain frequency, greatly favored all out-door interests.

No local storms of any remarkable degree of severity occurred. Storm warnings were displayed along the coast on the 16th.

TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 39 stations, was 59.1°, which was 1.2° below normal. The highest temperature was 90° at Indian Mills on the 2d, and Little Falls on the 18th, and the lowest, 26° at Layton, Sussex and Runyon on the 5th. The greatest daily range of temperature was 51° at Runyon on the 13th. The highest monthly mean temperature was 63.1° at Vineland, and the lowest, 55.7° at Charlotteburg.

The temperature departure from the normal for the year 1926, to date, by sections, is: The Highlands, -1.6°; Red Sandstone Plain, -1.9°; Southern Interior, -1.2°; Sea Coast, -0.4°.

PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 44 stations, was 2.58 inches, which was 1.09 inches below normal. The greatest monthly precipitation was 4.52 inches, at Tuckerton, and the least, 1.08 inches at Woodcliff Lake. The greatest amount of precipitation in any 24 consecutive hours was 3.00 inches at Cape May City on the 15-16th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 9, or 2 less than normal.

The precipitation accumulated departure from the normal for the year 1926, to date, by sections, is: The Highlands, -5.12 inches; Red Sandstone Plain, -4.89 inches; Southern Interior, -3.84 inches; Sea Coast, -3.80 inches.

WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 12 miles per hour, which was 1 mile above normal. The highest velocity, sustained for 5 consecutive

minutes, was 48 miles per hour from the west at Atlantic City on the 1st.

SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 18, which was 5 more than normal; partly cloudy, 9, or normal; cloudy, 4, or 5 less than normal. The per cent of possible sunshine was 75, which was 15 per cent above normal.

MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 29.89 inches, which was 0.10 inch below normal. The highest reading was 30.39 inches at Ridgefield and Verona on the 28th, and the lowest, 29.44 inches at Ridgefield on the 9th.

The mean stage of the Delaware river at Phillipsburg was 2.1 feet, and the highest 4.5 feet on the 1st. At Trenton the mean daily stage was 1.4 feet, which was 1.2 feet below normal; they highest stage was 2.7 feet on the 1st.

Dense fog occurred on the 2d and 19th. Thunderstorms were reported on the 3d, 14th to the 23d, inclusive, and 31st. Solar halos were observed on the 3d, 20th, 21st, 29th and 30th; lunar halos on the 26th and 30th. Killing frosts occurred in scattered northern localities as late as the 21st, and freezing temperatures in the cranberry bogs as late as the 29th. Light frost occurred on the 24th in several localities.

Light hail with no damage fell in the central part of the State on the 15th and in the northern part on the 19th.

ERRATA.

October, 1924: Sussex, total precipitation 0.01 inch; departure -3.43; Bridgeton, trace; departure, -3.59.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville and Runyon are Trenton.

Daily Precipitation for May, 1926

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXXI. JUNE, 1926. No. 6

### GENERAL SUMMARY.

Scattered throughout the month were some four or five days when temperatures were slightly above normal, otherwise it was generally decidedly colder than normal. In the record of more than 40 years there have been but three colder Junes, namely, in 1903, 1907, and in 1916, that of 1903 being slightly the coldest. In each of the above named months, there was a moderate excess of rainfall, that of 1903 having been the wettest June on record in New Jersey. The low temperature of June 1926, however, was accompanied by a marked deficiency of rain, so that no deleterious effects resulted to agriculture. Vegetation was some two weeks later than its usual stage of advancement, but growth was substantial.

The persistent low temperature was a frequent basis for comment, especially in connection with the fact that the three preceding months have been subnormal in warmth. June last year was the warmest on record, having been nearly nine degrees above that of this year.

Storm warnings were displayed along the northern coast on the 6th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 40 stations, was 64.9°, which was 3.6° below normal. The highest temperature was 97° at Cape May City on the 30th, and the lowest, 31° at Layton on the 20th. The greatest daily range of temperature was 48° at Belleplain on the 21st. The highest monthly mean temperature was 68.6° at Cape May City, and the lowest, 61.1° at Layton.

The temperature departure from the normal for the year 1926, to date, by sections, is: The Highlands, -2.0°; Red Sandstone Plain, -2.2°; Southern Interior, -1.5°; Sea Coast, -0.7°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 44 stations, was 2.60 inches, which was 1.10 inches below normal. The greatest monthly precipitation was 4.73 inches, at Indian Mills, and the least, 1.29 inches at Atlantic City. The greatest amount of precipitation in any 24 consecutive hours was 1.96 inches at Sussex on the 2d. The mean of the number of days on which 0.01 inch or more of precipitation fell was 11, or 1 more than normal.

The precipitation accumulated departure from the normal for the year 1926, to date, by sections, is: The Highlands, -5.68 inches; Red Sandstone Plain, -6.19 inches; Southern Interior, -5.10 inches; Sea Coast, -5.45 inches.

### WIND.

The prevailing wind direction was from the southwest. The wind movement averaged 11 miles per hour, which was 1 mile below normal. The highest velocity, sustained for 5 consecutive minutes, was 55 miles per hour from the northwest at Sandy Hook on the 2d.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 12, which was 1 less than normal; partly cloudy, 9, or 1 less than normal; cloudy, 9, or 2 more than normal. The per cent of possible sunshine was 63, which was 2 per cent above normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 1.8 feet, and the highest 2.6 feet on the 5th. At Trenton the mean daily stage was 1.0 foot, which was 0.9 foot below the normal; the highest stage was 1.8 feet on the 4th.

The mean atmospheric pressure, reduced to sea level, was 29.93 inches, which was 0.05 inch below normal. The highest reading was 30.28 inches at Ridgefield on the 17th and Sandy Hook on the 21st, and the lowest, 29.51 at Verona on the 15th.

Thunderstorms occurred on the 1st, 2d, 3d, 5th, 7th to the 10th, inclusive, 14th, 15th, and 22d to the 26th, inclusive. Solar halos were observed on the 3d, 6th, 20th, and 27th; and a lunar halo on the 28th. The aurora was observed on the 1st. Frosts were reported at scattered points as far south as the Southern Interior on some of the following dates: 4th, 17th, 20th, and 21st; Layton reported damage to tender plants on the 20th, with a minimum of 31°.

Scattered occurrences of hail were reported on the 2d, 7th, 8th, 10th, and 24th, without damage, except that of the 7th in portions of Cumberland County south of Bridgeton; in this storm, truck, fruit and plant beds for some 3 or 4 miles were ruined with a money loss of some \$150,000.

### ERRATA.

November, 1924: Clayton, monthly mean temperature 45.5d, instead of 45.0d, and departure +1.2 instead of +0.7; mean maximum 58.1c instead of 56.1c.

December, 1924: Bergen Point, 0.07 on 17th, total precipitation 2.58 inches instead of 2.51; departure -1.80 instead of -1.87; number of days with 0.01 inch or more 7 instead of 6. Average snowfall for the State 0.4 inch, which was 6.1 inches below normal instead of 4.3 inches with 2.2 inches below normal.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton.

## Daily Precipitation for June, 1926

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXXI.

JULY, 1926.

No. 7

### GENERAL SUMMARY.

Temperatures approached more nearly to normal warmth during July than in any month since February, for the State as a whole, although there were some stations whose mean temperatures were slightly above normal for the month. The warm and cool periods alternated with fairly uniform regularity. On the 21st and 22d readings were 100° or above at many stations, while from the 12th to the 16th there were many minima under 60°. There was a general lack of rain well into the 2d week, but thereafter rains were generous both in volume and frequency, so that the month closed with a moderate excess, except that in extreme northwestern sections there was a lack of rain which was keenly felt, approaching the seriousness of drought. This season, up to the time of increased rain during this month, has been one of the worst for forest fires, although these have not been entirely resultant from weather conditions. Thunder was heard in some part of the State on 19 days, and there were many instances of fire or other damage from lightning. Some stations reported as many as 15 rainy days, and rain has occurred at some time during nearly every week end since the latter part of May. During a seriously damaging wind storm at Sea Girt on the 24th it was reported, but not officially verified, that the wind reached 105 miles per hour.

Storm warnings were displayed along the coast on the 15th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 39 stations, was 73.0°, which was 0.6° below normal. The highest temperature was 105° at Phillipsburg on the 22d, and the lowest, 40°, at Belleplain on the 12th. The greatest daily range of temperature was 43° at Layton on the 12th. The highest monthly mean temperature was 76.0° at Burlington and Clayton, and the lowest, 69.4° at Charlotteburg.

The temperature departure from the normal for the year 1926, to date, by sections, is: The Highlands, -1.7°; Red Sandstone Plain, -2.0°; Southern Interior, -1.4°; Sea Coast, -0.6°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 47 stations, was 5.46 inches, which was 0.82 inch above normal.

The greatest monthly precipitation was 8.51 inches, at Atlantic City, and the least, 1.29 inches at Layton. The greatest amount of precipitation in any 24 consecutive hours was 3.51 inches at Chatham on the 25th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 12, or 2 more than normal.

The precipitation accumulated departure from the normal for the year 1926, to date, by sections, is: The Highlands, -6.65 inches; Red Sandstone Plain, -5.29 inches; Southern Interior, -3.87 inches; Sea Coast, -2.91 inches.

### WIND.

The prevailing wind direction was from the southwest. The wind movement averaged 10 miles per hour, which was about normal. The highest velocity, sustained for 5 consecutive minutes, was 56 miles per hour from the north at Atlantic City and Sandy Hook on the 18th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 16, which was 3 more than normal; partly cloudy, 7, or 4 less than normal; cloudy, 8, or 1 more than normal. The per cent of possible sunshine was 64, which was 1 per cent above normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 0.5 foot, and the highest 1.4 feet on the 1st. At Trenton the mean stage was 0.2 foot, which was 1.1 feet below normal. The highest stage, 0.6 foot, occurred on the 4th.

The mean atmospheric pressure, reduced to sea level, was 29.97 inches, which was 0.01 inch below normal. The highest reading was 30.32 inches on the 26th and the lowest, 29.52 inches on the 10th, both at Verona.

Thunderstorms occurred on the 3d to the 7th, inclusive, 10th, 11th, 13th, 14th, 15th, 18th, 19th, 20th, 22d to 25th, inclusive, 29th and 30th. Solar halos were observed on the 13th and 28th. Dense fog was noted on the 2d, 3d, 23d, 25th, and 29th.

Lightning struck the U. S. Naval ammunition depot at Lake Denmark near Dover, N. J., causing an explosion which killed many people and a damage of \$90,000,000. A severe wind storm on July 24th, did local damage along the shore between Asbury Park and Sea Girt, causing an estimated damage of \$100,000 to buildings.

Hail, with scattered unimportant damage, was reported at several points in north and central sections on the 18th.

### ERRATA.

Annual, 1924; Bergen Point, December precipitation 2.58, departure -1.80, instead of 2.51, departure -1.87. Total annual precipitation 41.41, instead of 41.34; departure -8.25 instead of -8.32. Number of days with 0.01 inch or more 94 instead of 93.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton.

## Daily Precipitation for July, 1926

## CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

Vol. XXXI.

August, 1926.

No. 8

## GENERAL SUMMARY.

The weather conditions during August were notable for their persistent heat and moisture. The month averaged nearly as warm as July and was the warmest August since 1918. Rainfall was excessive in all except south-central portions of the State, and the month closed with nearly all deficits of moisture for the growing season made up. Commencing with great quantities of rain on the 12th, it continued almost daily through the 25th and it proved to be the rainiest August since 1919, and one of the rainiest of any month for nearly ten years. The rain was mostly heavily distributed from Burlington to Bergen counties.

Local storms of marked violence occurred in the metropolitan district of the lower Hudson and New York Bay. That of the 12th caused countless instances of minor to great damage, from lightning, flooding of basements, sewers, etc., in many portions of the State. On the 16th a tornado developed probably over the Hackensack meadows and moved over Ridgefield and Morsemere, thence over the Palisades. It probably passed high enough in the air at this time to pass the Hudson and Manhattan without contact, but later was doubtless the controlling force of a water spout to the eastward of Manhattan. The damage in Morsemere and Ridgefield, while not of serious proportions in the aggregate, was total to some structures. The storm was about 100 feet wide, and moved from a general southwest to northeasterly direction. The rain accompanying this storm was accurately measured at Ridgefield, and amounted to 1.30 inches in 20 minutes.

Storm warnings were displayed along the coast on the 22d.

## TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 37 stations, was 72.8°, which was 0.8° above normal. The highest temperature was 101° at Bridgeton on the 13th and 14th, and the lowest, 38°, at Runyon on the 31st. The greatest daily range of temperature was 41° at Charlotteburg and Layton on the 10th. The highest monthly mean temperature was 76.4° at Vineland, and the lowest, 69.2° at Charlotteburg.

The temperature departure from the normal for the year 1926, to date, by sections, is: The Highlands, -1.3°; Red Sandstone Plain, -1.7°; Southern Interior, -1.1°; Sea Coast, -0.4°.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 43 stations, was 6.58 inches, which was 1.76 inches above normal.

The greatest monthly precipitation was 8.84 inches, at Hightstown, and the least, 3.74 inches at Bridgeton. The greatest amount of precipitation in any 24 consecutive hours was 4.59 inches at Hightstown on the 12-13th. The mean of the number of days on which 0.01 inch or more precipitation fell was 14, or 4 more than normal.

The precipitation accumulated departure from the normal for the year 1926, to date, by sections, is: The Highlands, -5.41 inches; Red Sandstone Plain, -2.71 inches; Southern Interior, -2.79 inches; Sea Coast, -0.69 inch.

## WIND.

The prevailing wind direction was from the east. The wind

movement averaged 10 miles per hour, which was 1 mile above normal. The highest velocity, sustained for 5 consecutive minutes, was 48 miles per hour from the northwest at Atlantic City on the 14th.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 11, which was 2 less than normal; partly cloudy, 9, or 2 less than normal; cloudy, 11, or 4 more than normal. The per cent of possible sunshine was 56, which was 10 per cent below normal.

## MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.01 inches, which was 0.01 inch above normal. The highest reading was 30.33 inches on the 21st and the lowest, 29.75 inches on the 7th, both at Ridgefield.

The mean stage of the Delaware River at Phillipsburg was 2.1 feet; and the highest, 4.5 feet on the 18th. At Trenton the daily stage was 1.2 feet, which was 0.1 foot above normal. The highest stage was 2.4 feet on the 20th.

Thunderstorms occurred on the 1st to 4th, inclusive, 7th, 8th, 12th to 17th, inclusive, 27th, 29th and 30th. Dense fog was noted on the 1st, 2d, 24th, and 25th. Solar halos were observed on the 2d and 23d.

Light hail with no damage fell at Bergen Point on the 7th and at two stations on the night of the 29-30th.

## ERRATA.

January, 1925: Greatest daily range for Atlantic City 33 instead of 32.

February, 1925: Precipitation departure for New York City -1.82 instead of -1.95; departure for Northfield -1.50, omitted.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville and Runyon are Trenton.

Daily Precipitation for August, 1926

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXXI.

SEPTEMBER, 1926.

No. 9

### GENERAL SUMMARY.

The outstanding features of September weather in 1926 were the variable changes indicative of the approach of autumn. Temperatures ranged from 93° to 32° and frosts, and the rain varied from 4.7 inches in 24 hours to 1.5 inches for the whole month. Cloudiness, sunshine, and wind were not far from normal, except that the prevailing winds were from the northeast, instead from a westerly quarter as normally occurs.

During the period from the 16th to the 25th, temperatures were very continuously above normal, culminating in the highest extreme on the 25th, whereupon a sharp drop occurred, with the coldest day of the month following on the 27th. The skies were almost continuously bright and sunny from the 11th to the 22d, but rains were frequent before this period, and almost daily from the 23d to the close of the month. On the 6th excessive rain occurred in the area extending from Mercer County northeastward to the vicinity of the lower Hudson and New York Bay, and there was considerable loss and damage from overflow of water courses and resultant flooding, and great inconvenience on account of the day being a holiday (Labor Day).

Agriculture made very good progress toward maturity, and there were but few adverse weather conditions affecting crops. Storm warnings were displayed along shore on the 15th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations, was 64.5°, which was 0.9° below normal. The highest temperature was 93° at Elizabeth and Indian Mills on the 25th, and the lowest, 32°, at Charlotteburg on the 27th. The greatest daily range of temperature was 43° at Layton and Charlotteburg on the 1st and 26th, respectively. The highest monthly mean temperature was 68.0° at Vineland, and the lowest, 60.4° at Charlotteburg.

The temperature departure from the normal for the year 1926, to date, by sections, is: The Highlands, -1.3°; Red Sandstone Plain, -1.7°; Southern Interior, -1.0°; Sea Coast, -0.4°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 44 stations, was 4.18 inches, which was 0.52 inch above normal.

The greatest monthly precipitation was 7.09 inches, at New Brunswick, and the least, 1.53 inches at Atlantic City. The greatest amount of precipitation in any 24 consecutive hours was 4.67 inches at Plainfield on the 6th. The mean of the number of days on which 0.01 inch or more precipitation fell was 10, or 2 more than normal.

The precipitation accumulated departure from the normal for the year 1926, to date, by sections, is: The Highlands, -5.24 inches; Red Sandstone Plain, -0.86 inch; Southern Interior, -2.94 inches; Sea Coast, -1.79 inches.

### WIND.

The prevailing wind direction was from the northeast. The wind movement averaged 11 miles per hour, which was 1 mile below normal. The highest velocity, sustained for 5 consecutive minutes, was 45 miles per hour from the north at Sandy Hook on the 26th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 14, which was 1 less than normal; partly cloudy, 6, or 2 less than normal; cloudy, 10, or 3 more than normal. The per cent of possible sunshine was 57, which was 11 per cent below normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.13 inches, which was 0.06 inch above normal. The highest reading was 30.41 inches at Verona on the 27th, and the lowest, 29.80 inches at Trenton on the 9th.

The mean stage of the Delaware River at Phillipsburg was 2.0 feet; and the highest, 4.8 feet on the 7th. At Trenton the mean stage was 1.1 feet, which was normal. The highest stage, 2.8 feet, occurred on the 8th.

Thunderstorms occurred on the 2d, 6th, 7th, 9th, 10th, 20th, 24th, 25th, and 26th. Light frost was reported on the 11th, 12th, and 14th, in the north portion of the State. Heavy frost was noted at Layton on the 1st.

### ERRATA.

March, 1925: Total precipitation for Dover 4.46 inches instead of 4.29, departure +0.47 instead of +0.30 inch.

June, 1925: Total precipitation for Layton, 3.52 instead of 3.32; departure -0.27 instead of -0.47 inch.

September, 1925: Total precipitation for South Orange 3.43 instead of 2.43; Dover, number of days with 0.01 inch or more 9 instead of 7.

November, 1925: Philadelphia, Pa., temperature departure, -0.3 instead of +1.6.

February, 1926: New Brunswick total snowfall 23.7 instead of 33.6 inches.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

‡ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. † Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton.

Daily Precipitation for September, 1926

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXXI.

OCTOBER, 1926.

No. 10

### GENERAL SUMMARY.

October weather throughout New Jersey was not more than ordinarily stormy, and was in marked contrast to October 1925, which was the coldest on record. Stormy conditions were infrequent, and although there was a slight excess of quantity of rain, and frequency of occurrence, the general conditions for the month were mostly pleasant. Rain occurred at fairly regular intervals. Snow occurred a few times at high altitudes above the State, as observed by aviators.

A few warm days occurred early in the month and at occasional, infrequent intervals thereafter, and the month averaged slightly subnormal in warmth. The 30th was especially warm, being some 10° or more above normal, and was a pleasing contrast with the snowstorm on October 30th, a year ago.

On the 25th, with sea-level pressure under 29.10 inches, severe wind storms did considerable local damage at widely separate points. Electric poles and trees were blown over, insecure roofs and signs were damaged and windows broken, in the region from Newark to Paterson. In Camden roofs of several buildings were destroyed and trees uprooted. There was no certain evidence that either of these storms was of the tornado type.

The reaction from this storm period produced the coldest weather of the month on the 28th, when temperatures were very generally below freezing.

The Aurora on the evening of the 14th was attended by considerable electrical interference.

Storm warnings were displayed along the coast on the 24th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 39 stations, was 53.1°, which was 1.8° below normal. The highest temperature was 90° at Indian Mills on the 4th, and the lowest, 17°, at Charlotteburg on the 28th. The greatest daily range of temperature was 48° at Runyon on the 12th. The highest monthly mean temperature was 57.6° at Vineland, and the lowest, 47.8° at Layton.

The temperature departure from the normal for the year 1926, to date, by sections, is: The Highlands, -1.4°; Red Sandstone Plain, -1.7°; Southern Interior, -1.1°; Sea Coast, -0.5°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 41 stations, was 4.08 inches, which was 0.32 inch above normal. A few extreme northern stations reported flurries of snow.

The greatest monthly precipitation was 6.03 inches, at Runyon, and the least, 1.79 inches at Bridgeton. The greatest amount of precipitation in any 24 consecutive hours was 2.00 inches at Belvidere on the 25th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 11, or 3 more than normal.

The precipitation accumulated departure from the normal for the year 1926, to date, by sections, is: The Highlands, -4.20 inches; Red Sandstone Plain, -0.09 inch; Southern Interior, -3.25 inches; Sea Coast, -2.16 inches.

### WIND.

The prevailing wind direction was from the northwest. The

wind movement averaged 12 miles per hour, which was normal. The highest velocity, sustained for 5 consecutive minutes, was 62 miles per hour from the southwest at Sandy Hook on the 25th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 13, which was 2 less than normal; partly cloudy, 8, or normal; cloudy, 10, or 2 more than normal. The per cent of possible sunshine was 57, which was 6 per cent below normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 29.96 inches, which was 0.11 inch below normal. The highest reading was 30.44 inches on the 1st at Verona and the lowest, 29.07 inches on the 25th, at Sandy Hook.

The mean stage of the Delaware River at Phillipsburg was 3.3 feet, and the highest stage, 7.3 feet on the 26th. At Trenton the mean stage was 1.9 feet, which was 0.5 foot above normal. The highest stage, 4.0 feet, occurred on the 27th.

Thunderstorms were reported on the 2d, 6th, 13th, 24th, 25th, and 31st. A solar halo was observed on the 3d and a lunar halo on the 16th. The aurora was observed on the 14th, 15th and 16th. Dense fog occurred on the 4th, 5th, 15th, 22d, and 31st. Sleet was reported on the 18th and 20th. Killing frost occurred in several localities on the 8th, 9th, 10th, and 16th; over practically all portions of the State on the 22d, except around New York Bay when the first killing frost occurred on the 27th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Union City; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Charlotteburg is Newfoundland.

## Daily Precipitation for October, 1926

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXXI.

NOVEMBER, 1926.

No. 11

### GENERAL SUMMARY.

Weather conditions during November of this year were not greatly different from those prevailing in November, 1925. Both temperature and precipitation were slightly greater than last year, although temperature was slightly subnormal. Thus another month deficient in warmth has occurred; there having been thus far in 1926, two months slightly above normal in warmth, and 9 colder than normal. Rain, both in frequency and volume, was only slightly above the normal. It was warm from the 7th to the 9th, and from the 14th to the 18th, and on the 26th, 29th and 30th. Temperatures were well down below freezing on the 11th, 12th, 27th and 28th, when the lowest temperature of the month occurred at nearly all stations.

A storm accompanied by the lowest pressure of the month occurred on the 16th, and considerable damage from wind and rain was reported. Electric poles were blown down, and trees and roofs were damaged in many portions of the State. The heavy rain in the Delaware River drainage area caused a stage of 11.3 feet (estimated), at Trenton, which was the highest stage since October 2, 1924.

Cold waves occurred on the 11th and 27th but possible damage from them had been well guarded against.

Storm warnings were displayed along the coast on the 9th, 15th, 16th, 18th, and 26th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations, was 42.5°, which was 0.4° below normal. The highest temperature was 76° at Runyon and Moorestown on the 9th and 15th respectively, and the lowest, 8°, at Belleplain on the 12th and 28th. The greatest daily range of temperature was 42° at Runyon on the 14th. The highest monthly mean temperature was 46.8° at Cape May City, and the lowest, 39.4° at Charlotteburg and Layton.

The temperature departure from the normal for the year 1926, to date, by sections, is: The Highlands, -1.2°; Red Sandstone Plain, -1.6°; Southern Interior, -1.1°; Sea Coast, -0.5°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 43 stations, was 4.04 inches, which was 0.93 inch above normal. The average total snowfall for the State was a trace, which was 1.2 inches below normal.

The greatest monthly precipitation was 7.19 inches, at Chatham, and the least, 2.44 inches at Atlantic City. The greatest amount of precipitation in any 24 consecutive hours was 2.70 inches at Chatham on the 10th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 9, or 1 more than normal.

The precipitation accumulated departure from the normal for the year 1926, to date, by sections, is: The Highlands, -2.97 inches; Red Sandstone Plain, +1.36 inches; Southern Interior, -2.66 inches; Sea Coast, -2.28 inches.

### WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 14 miles per hour, which was normal. The highest velocity, sustained for 5 consecutive minutes, was 72 miles per hour from the southeast at Atlantic City on the 16th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 13, which was 1 more than normal; partly cloudy, 8, or normal; cloudy, 9, or 1 less than normal. The per cent of possible sunshine was 57, which was 1 per cent below normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 6.0 feet, and the highest stage, 17.0 feet on the 18th. At Trenton the mean daily stage was 3.7 feet, which was 1.9 feet above normal. The highest stage was 11.3 feet on the 18th.

The mean atmospheric pressure, reduced to sea level, was 30.12 inches, which was 0.02 inch above normal. The highest reading was 30.63 inches at Verona on the 12th, and the lowest 29.30 inches at Sandy Hook on the 16th.

Dense fog occurred on the 8th, 9th and 26th. Thunderstorms were noted on the 9th, 10th, 18th, 26th and 27th. Solar halos were observed on the 13th, 21st, 28th and 29th; and lunar halos on the 14th and 22d.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Euglewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Union City; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Charlotteburg is Newfoundland.

## Daily Precipitation for November, 1926

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXXI.

DECEMBER, 1926.

No. 12

### GENERAL SUMMARY.

The month started with a rapid decrease in temperature, and there were cold waves on the 2d and 5th; during this first week it was in the neighborhood of 15° below normal. And again from the 16th to the 19th, temperatures were from 12° to 20° below normal. Zero readings were reported very generally in the northern half of the State, and portions of the southern interior, on the 7th, which was the day of lowest minima. Thereafter temperature fluctuations were about normal. The mean temperature of the entire State averaged 28.4°, and has been exceeded by only three colder Decembers, viz. in 1904, 1910 and 1917. Nearly all ponds and many streams were frozen early in the month, and remained closed. The Delaware River was frozen over the greater part of the month from Trenton upstream.

A snowstorm on the 5th, amounting to about 7 inches in the northern half of the State and less than half that depth in the southern half, was one of the heaviest early December storms of record. This snow had nearly all vanished by the middle of the month, but in shaded places there were traces of it on the ground at the close of the month.

Precipitation was frequent and scattered with fair regularity throughout the month. Occurrences of measureable snow varied from two days in the south to twelve in the north. Glaze formed to a considerable extent on the night of the 25-26th, but only slight damage to frail shrubbery and insecure wires resulted. Foot and vehicular traffic was unsafe from the icy pavements.

Although there was but little severely stormy weather, there was excessive cloudiness with a resulting deficiency of sunshine.

Storm warnings were displayed along the coast on the 5th, 6th, 13th, 25th, and 28th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations, was 28.4°, which was 4.4° below normal. The highest temperature was 52° at Runyon and Asbury Park on the 1st and 29th, respectively, and the lowest, 7° below zero at Somerville on the 7th. The greatest daily range of temperature was 42° at Little Falls on the 7th. The highest monthly mean temperature was 33.4° at Cape May City, and the lowest, 23.2° at Layton.

The temperature departure from the normal for the year 1926, to date, by sections, is: The Highlands, -1.5°; Red Sandstone Plain, -1.9°; Southern Interior, -1.3°; Sea Coast, -0.8°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 41 stations, was 3.44 inches, which was 0.54 inch below normal. The average total snowfall at twenty-two selected stations was 8.2 inches, which was 1.8 inches above normal.

The greatest monthly precipitation was 4.74 inches, at Chatham, and the least, 1.67 inches at Layton. The greatest amount of precipitation in any 24 consecutive hours was 1.90 inches at Tuckerton on the 28-29th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 11, or 2 more than normal.

The precipitation accumulated departure from the normal for the year 1926, to date, by sections, is: The Highlands, -4.11

inches; Red Sandstone Plain, +0.88 inch; Southern Interior, -3.03 inches; Sea Coast, -2.47 inches.

### WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 13 miles per hour, which was 1 mile below normal. The highest velocity, sustained for 5 consecutive minutes, was 60 miles per hour from the northwest at Sandy Hook on the 2d.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 11, which was 1 less than normal; partly cloudy, 7, or 2 less than normal; cloudy, 13, or 3 more than normal. The per cent of possible sunshine was 45, which was 7 per cent below normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.10 inches, which was normal. The highest reading was 30.62 inches at Sandy Hook and Trenton, on the 18th and 19th, respectively, and the lowest 29.52 inches at Atlantic City on the 26th.

The mean stage of the Delaware River at Trenton was 2.3 feet, which was 0.3 foot below normal. The river was frozen practically the whole month at Phillipsburg.

Dense fog was observed on the 13th and 14th. Solar halos were noted on the 3d, 4th, 9th, 19th, and 31st; and lunar halos on the 17th and 19th. Sleet fell on the 3d, 5th, 7th to the 11th inclusive, 14th, 15th, 20th, 21st, 24th, 25th, 26th and 28th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01

Inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Union City; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Charlotteburg is Newfoundland.

## Daily Precipitation for December, 1926

# CLIMATOLOGICAL DATA.

NEW JERSEY SECTION,  
G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXXI. ANNUAL SUMMARY, 1926. No. 13

## GENERAL SUMMARY.

The outstanding weather feature of the year was the persistent subnormal temperature, every month showing a deficiency in warmth except January and August. There have been but two colder years on record in New Jersey, viz. 1917 and 1904, and one year the same, 1888. The total deficiency in temperature for the year averaged 1.5°, and was not materially noticeable except that in spring and early summer crops were some two weeks or more late, but on toward harvest this delay was largely accounted for. The great vacation resorts along the shore experienced unfavorable seasons due to the cool and rainy weather. From March to June, inclusive, there was a persistent deficiency in rain, but thereafter there were monthly excesses, except in December. August was a very rainy month, and there was considerable flooding in various localities due to the heavy downpours; this condition prevailed also in early September. There were severe wind storms which caused locally total damage to insecure structures in July, October, and November and a tornado of typical formation occurred at Ridgefield in August, with moderate damage. February was one of the most snowy months of record, and there was considerable delay to traffic of all kinds, and highways were somewhat obstructed for brief intervals. Heavy rains in the Delaware river drainage area on November 16th, caused very high water on the 18th, but without dangerous conditions developing, and no very great damage resulted.

The yearly total precipitation for the State was again slightly subnormal, and in the past 25 years, there have been but ten wherein the yearly precipitation has equalled or exceeded normal.

The mean temperature for the year, 50.0°, was 1.5° below normal. The warmest month was July, 73.0°, and the coldest, December, 28.4°. The highest temperature was 105° at Phillipsburg on July 22d, and the lowest, 11° below zero at Layton on February 9th. The highest mean temperature was 53.6° at Cape May City and Vineland, and the lowest, 46.1° at Layton. The greatest annual range of temperature was 114° at Layton.

The average precipitation for the State was 44.41 inches, which was 1.83 inches below normal. The greatest monthly average was 6.58 inches in August, and the least, 2.05 inches in April. The greatest monthly amount of precipitation was 8.84 inches at Hightstown in August, and the least, 1.08 inches at Woodcliff Lake in May. The greatest annual precipitation was 55.66 inches at Chatham, and the least, 36.77 inches at Layton.

The average snowfall for the State was 32.2 inches, which was 3.4 inches above normal. The greatest annual snowfall was 57.5 inches at Layton, and the least, 6.4 inches at Cape May City.

The average number of days on which 0.01 inch or more precipitation occurred was 122, which was 8 more than normal. The average number of clear days was 157, which was 5 more than normal; partly cloudy, 95, which was 14 less than normal; cloudy, 113, which was 9 more than normal.

The prevailing wind direction was from the northwest; the highest velocity was 78 miles per hour from the northeast at Atlantic City on February 4th.

A hail storm on June 7th caused the loss of \$150,000 to truck, fruit and plant beds in portions of Cumberland County south of Bridgeton. Light hail, with no material damage fell on Feb-

ruary 14th and 25th; April 3d and 24th; May 15th and 19th; June 2d, 7th, 8th, 10th and 24th; July 18th; August 7th and night of 29-30th.

## COMPARATIVE ANNUAL DATA FOR THE STATE

VOL. XXXII.

JANUARY, 1927.

No. 1

### GENERAL SUMMARY.

Winter weather of approximate normal type occurred during January, 1927 in New Jersey. There was a slight deficiency from normal in warmth, precipitation and sunshine, and a little more snow than usual, but the snow occurred in practically all one storm. This snow was closely followed by a period of 5 days of excessive warmth, and the snow entirely disappeared. The total precipitation was the least for January since 1916. There were cold waves on the 15th and 27th, but they were not severe nor of long duration. Temperatures below zero were very general from central sections northward on the 27th, attendant upon pressure of 31 inches, closely approaching the highest pressure on record in this section. The variation in heat and cold was rather abrupt, with warm and cold periods persisting for several days at a time with fair regularity.

On the whole the weather gave the general impression of being mild and open.

Storm warnings were displayed along the coast on the 4th, 15th, and 16th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 36 stations, was 29.2°, which was 0.7° below normal. The highest temperature was 70° at Pleasantville on the 22d, and the lowest 12° below zero at Culvers Lake on the 27th. The greatest daily range of temperature was 44° at Belleplain and Indian Mills on the 28th. The highest monthly mean temperature was 32.6° at Atlantic City and Cape May City, and the lowest, 24.2° at Layton.

The temperature departure from the normal for the year 1927, to date, by sections, is: The Highlands, 0.0°; Red Sandstone Plain, -0.8°; Southern Interior, -0.9°; Sea Coast, -1.0°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 40 stations, was 2.22 inches, which was 1.39 inches below normal. The average total snowfall at eight selected stations was 7.9 inches, which was 0.5 inch above normal.

The greatest monthly precipitation was 3.32 inches, at Runyon, and the least, 1.19 inches at Atlantic City. The greatest amount of precipitation in any 24 consecutive hours was 1.44 inches at Sussex on the 15-16th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 11, or 1 more than normal.

The precipitation accumulated departure from the normal for the year 1927, to date, by sections, is: The Highlands, -0.76 inch; Red Sandstone Plain, -1.57 inches; Southern Interior, -1.47 inches; Sea Coast, -1.89 inches.

### WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 13 miles per hour, which was 1 mile below normal. The highest velocity, sustained for 5 consecutive minutes, was 54 miles per hour from the northwest at Sandy Hook on the 16th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 11, which was normal; partly cloudy, 7, or 2 less than normal; cloudy, 13, or 2 more than normal. The per cent of possible sunshine was 46, which was 4 per cent below normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.15 inches, which was 0.04 inch above normal. The highest reading was 31.03 inches at Verona, on the 27th, and the lowest, 29.35 inches at Sandy Hook and Verona on the 4th.

The Delaware River remained frozen most of month at Trenton and Phillipsburg. The highest readings obtained were 5.8 feet at Trenton and 8.0 feet at Phillipsburg, both on the 24th.

Dense fog occurred on the 14th, 19th, 20th, 21st, 22d, 29th and 30th. Sleet fell on the 22d, 23d, 24th, 28th and 29th. A solar halo was observed on the 8th, and lunar halos on the 13th and 16th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Union City; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Charlotteburg is Newfoundland.

## Daily Precipitation for January, 1927

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXXII.

FEBRUARY, 1927.

### GENERAL SUMMARY.

The weather during February in New Jersey was more than usually pleasant and mild with remarkable persistence. There were four pronounced warm periods lasting from four to six days each, and the intervening periods were not more than 3° or 4° colder than normal. February 1925 was slightly warmer than this month and was accompanied by the least February snowfall of record. In 1926 the February snowfall record was the greatest with one exception, while this year the amount of snow was subnormal, except possibly in extreme northern localities.

The frequency of stormy weather was slightly greater than usual, although there was a deficiency of precipitation. The storm of the 19-20th was severe and caused much damage inland by destruction of telephone and other electrical service, by glaze particularly, and by destruction of property by wind and wave along shore and at sea. The coast from Sandy Hook to Cape May was savagely battered by an unusually high storm wave driven by gales, which exceeded 80 miles per hour from the northeast. Foundations were undermined and buildings wrecked. The center of the storm was some distance to the eastward off the coast. A storm of the same type moved along shore on the 26th, but was much less severe. A sleet and glaze storm on the 5th caused moderate inconveniences and damage. The month closed with normally pleasant conditions.

Storm warnings were displayed along shore on the 13th, 16th, 19th, 20th, 25th, 26th and 27th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations, was 36.1°, which was 6.5° above normal. The highest temperature was 66° at Belleplain and Vineland on the 17th, and the lowest 4° at Culvers Lake on the 12th. The greatest daily range of temperature was 38° at Pleasantville on the 17th. The highest monthly mean temperature was 40.6° at Tuckerton and Vineland, and the lowest, 31.6° at Layton.

The temperature departure from the normal for the year 1927, to date, by sections, is: The Highlands, +3.6°; Red Sandstone Plain, +2.4°; Southern Interior, +3.0°; Sea Coast, +2.5°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 39 stations, was 3.12 inches, which was 0.43 inch below normal. The average total snowfall at eighteen selected stations was 5.1 inches, which was 1.5 inches below normal.

The greatest monthly precipitation was 4.55 inches, at Hightstown, and the least, 2.18 inches at Runyon. The greatest amount of precipitation in any 24 consecutive hours was 1.86 inches at Atlantic City on the 19-20th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 11, or 2 more than normal.

The precipitation accumulated departure from the normal for the year 1927, to date, by sections, is: The Highlands, -1.10

inches; Red Sandstone Plain, -2.52 inches; Southern Interior, -1.58 inches; Sea Coast, -2.03 inches.

### WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 14 miles per hour, which was normal. The highest velocity, sustained for 5 consecutive minutes, was 84 miles per hour from the northeast at Atlantic City on the 20th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 10, which was 1 less than normal; partly cloudy, 8, or normal; cloudy, 10, or 1 more than normal. The per cent of possible sunshine was 54, which was 2 per cent below normal.

### MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, was 30.02 inches, which was 0.08 inch below normal. The highest reading was 30.46 inches at Trenton and Atlantic City on the 1st, and the lowest, 29.49 inches at Sandy Hook on the 26th.

The mean stage of the Delaware River at Phillipsburg was 3.7 feet, and the highest stage, 6.5 feet on the 27th. At Trenton the mean daily stage was 2.7 feet, which was 0.6 foot below normal. The highest stage was 4.3 feet on the 27th. Sleet fell on the 5th, 6th, 13th, 14th, 16th, 18th, 19th and 20th. Dense fog occurred on the 6th, 15th, 17th, 18th and 21st. Solar halos were observed on the 1st, 13th, 16th, 22d, 23d, 24th and 25th. Thunderstorms occurred on the 16th, 17th, 18th and 25th.

### COMPARATIVE DATA FOR FEBRUARY

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Union City; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Charlotteburg is Newfoundland.

## Daily Precipitation for February, 1927

## U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

CHARLES F. MARVIN, Chief.

## CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

Vol. XXXII.

MARCH, 1927.

No. 3

## GENERAL SUMMARY.

The weather during March was remarkable in three important elements. There have been but three drier Marches on record for the entire State, and along portions of the fall line across the State it was the driest March on record. The snowfall was negligible and was five and a half inches below normal. The temperature was considerably above normal, although it did not approach high records for warmth. The March winds, famed for their boisterous turbulence, were notably lacking, and there was hardly any period of the month which would be considered typical of its usual disagreeable characteristics. There was a persistent period from the 5th to the 20th, when the warmth was above normal, and on the 17th and 18th, temperatures were very generally well up in the 70's. On the whole it was a month which will long be a record as particularly pleasant.

There is a sound basis for the traditional stormy weather of March. During the years from 1885 to date, when records of the entire State have been carefully tabulated, the mean temperature of the State has varied from 30° to 49°; the extreme high was 92°, and the extreme low was 15° below zero; and the snowfall has ranged from nothing for the month to 20 inches. The March with no snow whatever was in 1903, and the 20 inches occurred in 1914.

Storm warnings were displayed along the coast on the 1st, 2d, 8th and 26th.

## TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations, was 41.9°, which was 3.3° above normal. The highest temperature was 81° at Lakewood and Runyon on the 18th, and the lowest 9° at Layton on the 2d. The greatest daily range of temperature was 50° at Sussex on the 17th. The highest monthly mean temperature was 45.4° at Moorestown, and the lowest, 38.2° at Charlotteburg.

The temperature departure from the normal for the year 1927, to date, by sections, is: The Highlands, +3.8°; Red Sandstone Plain, +2.7°; Southern Interior, +3.2°; Sea Coast, +2.6°.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 43 stations, was 1.46 inches, which was 2.42 inches below normal. The average total snowfall at sixteen selected stations was 0.3 inch, which was 5.5 inches below normal.

The greatest monthly precipitation was 2.73 inches at Indian Mills, and the least, 0.78 inch at New Brunswick. The greatest amount of precipitation in any 24 consecutive hours was 1.10 inches at Indian Mills on the 22d. The mean of the number of days on which 0.01 inch or more of precipitation fell was 10, or 1 less than normal.

The precipitation accumulated departure from the normal for the year 1927, to date, by sections, is: The Highlands, -3.08 inches; Red Sandstone Plain, -5.10 inches; Southern Interior, -4.06 inches; Sea Coast, -4.59 inches.

## WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 12 miles per hour, which was 3 miles below normal. The highest velocity, sustained for 5 consecutive minutes, was 61 miles per hour from the north at Sandy Hook on the 2d.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 14, which was 2 more than normal; partly cloudy, 7, or 2 less than normal; cloudy, 10, or normal. The per cent of possible sunshine was 59, which was 2 per cent below normal.

## MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 7.6 feet, and the highest stage, 13.0 feet on the 15th. At Trenton the mean daily stage was 4.1 feet, which was normal. The highest stage was 7.5 feet on the 16th.

The mean atmospheric pressure, reduced to sea level, was 30.11 inches, which was 0.10 inch above normal. The highest reading was 30.55 inches at Ridgefield on the 11th, and the lowest, 29.44 at Sandy Hook on the 8th.

Dense fog was reported on the 12th, 14th, 20th, 21st and 28th. Sleet occurred on the 22d, 24th, 27th and 28th. Thunderstorms were recorded on the 18th, 19th, 20th, 21st and 22d. Solar halos were observed on the 9th, 12th, 25th, and 30th; and a lunar halo was observed on the 12th. No hail was reported.

## COMPARATIVE DATA FOR MARCH

| Year | Temperature |         |        | Precipitation |          |       |          | No. of days |               |        |                        |

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Union City; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Charlotteburg is Newfoundland.

## Daily Precipitation for March, 1927

APRIL, 1927.

No. 4

## GENERAL SUMMARY.

The month of April was consistently subnormal in warmth, except the third week, when persistently warm weather prevailed, culminating on the 20th, with temperatures very generally in the 90's; except along the immediate coast. This was followed by reactionary thundershowers on the 21st, when the heaviest rain in several months occurred. The mean temperatures of April this year and last year were the lowest recorded since 1911, and were in marked contrast with April 1921, which was the warmest ever recorded in New Jersey. The general progression of the temperature march was upward, except that a cool period on the 23d-24th rendered the last week of the month cooler than the 2d and 3d weeks, but did not prove to be a serious check to vegetation. Scattered occurrences of frost on the 25th in southern counties damaged the bloom of peach trees and strawberry patches located in peculiarly susceptible situations. The cold ground retarded the germination of seed to a moderate but unimportant extent.

Except for the heavy thundershowers on the 21st-22d, the rainfall was light, and practically none fell from the 7th to the 16th, and the need of moisture was then becoming somewhat more pronounced, but the persistence of the low temperatures prevented the need of rain from becoming acute. A few stations reported a light fall of snow on the 2d, but it was unimportant.

More than the usual amount of fair weather prevailed, without any outstanding wind turbulence.

Storm warnings were displayed along the coast on the 1st, 9th and 26th.

## TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations, was 47.5°, which was 1.9° below normal. The highest temperature was 93° at Runyon and Somerville on the 20th, and the lowest 17° at Runyon on the 10th. The greatest daily range of temperature was 46° at Layton on the 15th, and at Runyon on the 11th, 12th, and 15th. The highest monthly mean temperature was 50.7° at Vineland, and the lowest, 44.7° at Charlotteburg and Layton.

The temperature departure from the normal for the year 1927, to date, by sections, is: The Highlands, +2.3°; Red Sandstone Plain, +1.5°; Southern Interior, +1.9°; Sea Coast, +1.8°.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 44 stations, was 2.42 inches, which was 1.25 inches below normal. The average total snowfall at twenty-two selected stations was 0.3 inch, which was 1.2 inches below normal.

The greatest monthly precipitation was 3.97 inches at Moorestown, and the least, 1.00 inch at Northfield. The greatest amount of precipitation in any 24 consecutive hours was 2.58 inches at Moorestown on the 21st-22d. The mean of the number of days on which 0.01 inch or more of precipitation fell was 9 or 1 less than normal.

The precipitation accumulated departure from the normal for the year 1927, to date, by sections, is: The Highlands, -4.21 inches; Red Sandstone Plain, -6.36 inches; Southern Interior, -5.38 inches; Sea Coast, -5.86 inches.

## WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 13 miles per hour, which was normal. The highest velocity, sustained for 5 consecutive minutes, was 51 miles per hour from the northeast at Atlantic City on the 2d.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 14, which was 2 more than normal; partly cloudy, 7, or 2 less than normal; cloudy, 9, or normal. The per cent of possible sunshine was 60, which was 3 per cent above normal.

## MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 3.6 feet, and the highest 4.7 feet on the 26th. At Trenton the mean daily stage was 2.2 feet, which was 1.7 feet below normal, the highest stage was 3.1 feet on the 29th.

The mean atmospheric pressure, reduced to sea level, was 30.08 inches, which was 0.08 inch above normal. The highest reading was 30.54 inches at Verona and Sandy Hook on the 15th, and the lowest, 29.41 inches at Atlantic City on the 27th.

Dense fog was reported on the 18th. Sleet fell on the 1st, 2d, 5th and 13th. Thunderstorms occurred on the 2d, 5th, 21st, 22d, 26th and 27th. Solar halos were observed on the 8th, 9th, 16th, 26th and 29th, and a lunar halo on the 8th. An aurora was observed at Layton on the 12th. The last killing frost of the season occurred on the 25th and in some instances the next few following days throughout the interior portions of the State.

Light hail with no damage fell at Burlington on the 5th and at Asbury Park on the 21st.

## COMPARATIVE DATA FOR APRIL

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

‡ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Union City; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Charlotteburg is Newfoundland.

## Daily Precipitation for April, 1927

NEW JERSEY SECTION.  
G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXXII.

MAY, 1927.

No. 5

## GENERAL SUMMARY.

The weather during May did not vary very greatly from normal, but two factors gradually developed which made it seem to be markedly abnormal. The temperatures were decidedly subnormal, but to no great degree, during the last three weeks, with few exceptions, and the frequency of rain was slightly oftener than usual. Mean temperature and total precipitation were both somewhat subnormal, but not enough to cause any unusually marked result. Had the subnormal warmth been accompanied by excessive rain, very serious crop situations would have developed; and if this lack of rain had been attended by very warm weather, drought conditions would have readily developed. It was a little cooler and wetter than May of last year in this region, but not as cool as in the corresponding month of 1925, nor as wet as that of 1924. The occurrences of frost were much the same as in 1926 and also other Mays of earlier years. Although both April and May have been slightly subnormal in warmth, they have been more than offset by an excess of heat in earlier months of the year, so that the year to date is not showing any marked variation in temperature. The deficiency in precipitation is becoming more marked, and is slightly overrunning the deficiency of last year, accumulated for the same relative period. The number of clear days, averaging the entire State, was the lowest since 1908. At many northern stations there was a slight excess of precipitation, but in the southern half all localities were deficient. In the southwestern interior of the State the temperature deficiency was hardly noticeable.

A wind squall about 7:30 p. m. on the 10th in Union County and adjoining regions destroyed some frame buildings of considerable size. It was probably a line squall as there were no decided evidences of tornadic development.

No storm warnings were displayed during the month.

## TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 39 stations, was 58.1°, which was 2.3° below normal. The highest temperature was 88° at Lakewood on the 10th, and at Bridgeton on the 24th, and the lowest 30° at Layton on the 8th, and at Charlotteburg on the 29th. The greatest daily range of temperature was 44° at Layton on the 29th. The highest monthly mean temperature was 62.5° at Vineland, and the lowest, 54.9° at Charlotteburg.

The temperature departure from the normal for the year 1927, to date, by sections, is: The Highlands, +1.3°; Red Sandstone Plain, +0.7°; Southern Interior, +1.1°; Sea Coast, +1.2°.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 44 stations, was 3.65 inches, which was 0.21 inch below normal.

The greatest monthly precipitation was 8.16 inches, at Chat-ham, and the least, 1.93 inches at Phillipsburg. The greatest amount of precipitation in any 24 consecutive hours was 1.94 inches at Somerville on the 24-25th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 13, or 2 more than normal.

The precipitation accumulated departure from the normal for the year 1927, to date, by sections, is: The Highlands, -4.17 inches; Red Sandstone Plain, -5.62 inches; Southern Interior, -6.62 inches; Sea Coast, -6.30 inches.

## WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 11 miles per hour, which was normal. The highest velocity, sustained for 5 consecutive minutes, was 50 miles per hour from the west at Sandy Hook on the 26th.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 9, which was 4 less than normal; partly cloudy, 10, or 1 more than normal; cloudy, 12, or 3 more than normal. The per cent of possible sunshine was 53, which was 7 per cent below normal.

## MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 29.92 inches, which was 0.07 inch below normal. The highest reading was 30.49 inches at Ridgefield on the 21st, and the lowest, 29.49 inches at Verona on the 26th.

The mean stage of the Delaware River at Phillipsburg was 5.0 feet, and the highest 10.0 feet on the 26th. At Trenton the mean daily stage was 2.8 feet, which was 0.2 foot above normal: the highest stage was 5.9 feet on the 26th.

Dense fog occurred on the 10th and 25th. Thunderstorms were reported on the 6th, 9th to 12th, inclusive, 14th, 15th, 16th, 19th, 23d to 26th, inclusive and 31st. Solar halos were observed on the 5th and 8th.

Light to heavy frost occurred in many susceptible localities of interior portions of the State on the 28th and 29th.

Light hail, without damage occurred in a few scattered localities on the 15th. Light hail occurred in many localities of the interior on the 26th without damage, except injury to a few tender plants in Burlington county.

## COMPARATIVE DATA FOR MAY

| Year      | Temperature |         |        | Precipitation |          |       | No. of days |               |        |                        |

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Union City; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Charlotteburg is Newfoundland.

## Daily Precipitation for May, 1927

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXXII.

JUNE, 1927.

No. 6

### GENERAL SUMMARY.

Weather conditions during June as a whole were more than ordinarily pleasant; there were but few uncomfortably hot days; rain was deficient both in frequency and amount; and fair weather prevailed to a greater extent than usual. The climate of this region and of practically all continental temperate zones is usually abnormal; i. e. the so called normal is made up from the habitually recurring changeableness of the various weather sequences. From this standpoint it was a typical June; not as warm as some, but warmer than some others. The rainfall was adequate in many sections of the State for customary needs, but was deficient in others. The warm periods of the month were from the 9th to the 12th, 23d and 29th, and although it was warmer over the western half of the State, the departure from normal warmth was less near the coast than elsewhere.

The lack of rain, added to the accumulated deficiency thus far this season, was unfavorable to the best growth of vegetation of certain kinds, but hay and potatoes seemed to be very favorably affected.

The persistent and accumulating deficiency in rain is becoming rather a prominent and important feature for the year thus far.

Storm warnings were displayed along the coast on the 14th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations, was 65.4°, which was 3.2° below normal. The highest temperature was 97° at Phillipsburg on the 10th, and at Belvidere on the 29th, and the lowest, 31°, at Belleplain on the 2d. The greatest daily range was 44° at Runyon on the 2d. The highest monthly mean temperature was 68.4° at Vineland, and the lowest, 61.8° at Layton.

The temperature departure from the normal for the year, 1927, to date, by sections, is: The Highlands, +0.5°; Red Sandstone Plain, 0.0; Southern Interior, +0.4°; Sea Coast, +0.7°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 44 stations, was 3.16 inches, which was 0.60 inch below normal.

The greatest monthly precipitation was 5.24 inches, at Belvidere, and the least, 1.46 inches, at Tuckerton. The greatest amount of precipitation in any 24 consecutive hours was 1.70 inches at Belvidere on the 19th-20th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 9, or 1 less than normal.

The precipitation accumulated departure from the normal for the year 1927, to date, by sections, is: The Highlands, -4.47 inches; Red Sandstone Plain, -5.94 inches; Southern Interior, -7.69 inches; Sea Coast, -6.92 inches.

### WIND.

The prevailing wind direction was from the northwest. The

wind movement averaged 11 miles per hour, which was 1 mile below normal. The highest velocity, sustained for 5 consecutive minutes, was 50 miles per hour from the northwest at Sandy Hook on the 5th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 15, which was 2 more than normal; partly cloudy, 9, or 1 less than normal; cloudy, 6, or 1 less than normal. The per cent of possible sunshine was 66, which was 5 per cent above normal.

### MISCELLANEOUS.

The mean stage of the Delaware at Phillipsburg was 3.2 feet, and the highest 5.0 feet on the 20th. At Trenton the mean daily stage was 1.8 feet, which was 0.1 foot below normal; the highest stage was 2.9 feet on the 1st.

The mean atmospheric pressure, reduced to sea level, was 30.00 inches, which was 0.02 inch above normal. The highest reading was 30.30 inches at Atlantic City on the 28th, and the lowest, 29.62 at Verona on the 10th.

Thunderstorms occurred on the 4th, 5th, 9th, 10th, 11th, 14th, 22d to 26th inclusive, 29th and 30th. Solar halos were observed on the 4th, 6th, 7th, 9th, 15th and 17th; and a lunar halo was observed on the 6th. Dense fog was noted on the 18th and 26th. An earthquake occurred on the 1st. Frost caused slight damage in the cranberry bogs on the 2d. Light frost occurred in the extreme northern portions on the 7th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

¶ Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Union City; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Charlotteburg is Newfoundland.

## Daily Precipitation for June, 1927

CLIMATOLOGICAL DATA.

NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXXII. JULY, 1927. No. 7

GENERAL SUMMARY.

Weather conditions were generally typical of the midsummer month, with warmth and rain not varying greatly from normal. There were fewer disastrous sudden squalls attendant upon thunderstorms than usual, and taking all weather elements into consideration it was a more than ordinarily pleasant month. There were two hot periods, from the 12th to the 18th, and from the 26th to the close of the month, but these were more than offset by subnormal warmth at other times, so that the month averaged slightly subnormal in temperature. There have been six cooler Julys, however, than this one, during the past 14 years, so that it would appear that conditions were practically average.

The greater portion of the rainfall occurred in one or two heavy downpours, which were not uniform as to dates throughout the State. These resulted in occasional local flooding of artificial water courses, while other parts of the State were entirely dry. The rain was generously distributed throughout the State, the only deficiencies being slight and unimportant in Burlington, Mercer, and Warren Counties.

The accumulated temperature conditions of the State for the year to date are about normal, while the precipitation is somewhat deficient.

Storm warnings were displayed along the coast on the 2d.

TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 37 stations, was 72.7°, which was 1.0° below normal. The highest temperature was 99° at Runyon and Somerville on the 13th, and the lowest, 36°, at Charlotteburg on the 6th. The greatest daily range of temperature was 43° at Belleplain and Runyon on the 5th and 6th, respectively. The highest monthly mean temperature was 75.7° at Vineland, and the lowest, 69.0° at Charlotteburg.

The temperature departure from the normal for the year, 1927, to date, by sections, is: The Highlands, +0.3°; Red Sandstone Plain, -0.2°; Southern Interior, +0.2°; Sea Coast, +0.5°.

PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 43 stations, was 6.06 inches, which was 1.27 inches above normal.

The greatest monthly precipitation was 9.34 inches, at Verona, and the least, 2.95 inches at Phillipsburg. The greatest amount of precipitation in any 24 consecutive hours was 4.31 inches at Chatham on the 23d. The mean of the number of days on which 0.01 inch or more of precipitation fell was 11, or 1 more than normal.

The precipitation accumulated departure from the normal for the year 1927, to date, by sections, is: The Highlands, -3.73 inches; Red Sandstone Plain, -4.23 inches; Southern Interior, -6.65 inches; Sea Coast, -5.29 inches.

WIND.

The prevailing wind direction was from the southwest. The wind movement averaged 11 miles per hour, which was 1 mile above normal. The highest velocity, sustained for 5 consecutive

minutes, was 52 miles per hour from the southwest at Sandy Hook on the 18th. High winds also occurred on the 2d, 7th, 16th and 19th.

SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 13, which was normal; partly cloudy, 10, or 1 less than normal; cloudy, 8, or 1 more than normal. The per cent of possible sunshine was 64, which was 1 per cent above normal.

MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 1.9 feet, and the highest, 3.6 feet on the 25th. At Trenton the mean stage was 1.0 foot, which was 0.3 foot below normal. The highest stage, 2.4 feet, occurred on the 24th.

The mean atmospheric pressure, reduced to sea level, was 29.99 inches, which was 0.01 inch above normal. The highest reading was 30.29 inches on the 21st at Ridgefield, and the lowest, 29.70 inches on the 7th at Trenton.

Thunderstorms occurred on the 3d, 7th, 13th to 19th, inclusive, 23d, and 27th to the 31st inclusive. Solar halos were observed on the 6th, 7th, 9th and 20th. Dense fog was noted on the 10th, 11th, 12th, 20th and 21st. There were indications of light frost on the 5th at Layton.

Light hail occurred on the 7th in Ocean and Monmouth counties causing scattered slight damage, also over portions of Essex and Bergen counties; also on the 27th at Layton.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T. precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Union City; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Charlotteburg is Newfoundland.

## Daily Precipitation for July, 1927

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXXII.

AUGUST, 1927.

No. 8

### GENERAL SUMMARY.

August, 1927 will probably be a record for both low temperature and excess of rain for a long period to come. In this playground State where favorable weather is a factor of first importance during the midsummer months, this record has caused widespread comment and much disappointment at the seashore and other resorts. It was the coldest August since records for the entire State were first compiled in 1885, and one of the three rainiest, the only wetter Augusts being in 1901 and 1911. The low temperature was not a condition of absolute cold, for the nights were but slightly cooler than normal, but was due to the fact that it did not warm up during the daylight hours as is normally the case. Fog was noticeably frequent, and the greater portion of the rain fell in some three or four showers. The rainiest portion of the State was from Middlesex county northward into Passaic, and therefore did not greatly affect the agricultural situation. While the crop condition was not of the best, it was much better than in some other years when weather conditions would have seemed to be less unfavorable. The cold August of 1903 appears to have been a very unfavorable midsummer month for crops.

The accumulated factors of precipitation and temperature for the year 1927 to date are just about normal, the variation being immaterial.

Storm warnings were displayed along the coast on the 23d and 24th for a tropical storm which caused considerable damage to shipping to the northeastward of the New Jersey coast.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 37 stations, was 67.1°, which was 4.9° below normal. The highest temperature was 89° at Bridgeton, Indian Mills and Vineland on the 7th, and at Indian Mills and Runyon on the 8th, and the lowest, 37°, at Belleplain on the 25th. The greatest daily range of temperature was 38° at Belleplain on the 25th. The highest monthly mean temperature was 70.5° at Vineland, and the lowest, 63.7° at Charlotteburg.

The temperature departure from the normal for the year, 1927, to date, by sections, is: The Highlands, -0.3°; Red Sandstone Plain, -0.8°; Southern Interior, -0.4°; Sea Coast, -0.1°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 42 stations, was 8.55 inches, which was 3.48 inches above normal.

The greatest monthly precipitation was 12.87 inches, at Plainfield, and the least, 2.88 inches at Cape May City. The greatest amount of precipitation in any 24 consecutive hours was 4.32 inches at Plainfield on the 8-9th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 12, or 2 more than normal.

The precipitation accumulated departure from the normal for the year 1927, to date, by sections, is: The Highlands, -0.43 inch; Red Sandstone Plain, +1.19 inches; Southern Interior, -4.63 inches; Sea Coast, -3.45 inches.

### WIND.

The prevailing wind direction was from the southwest. The wind movement averaged 10 miles per hour, which was 1 mile above normal. The highest velocity, sustained for 5 consecutive

minutes, was 62 miles per hour from the northeast at Atlantic City on the 26th. High winds also occurred on the 1st, 8th, 26th and 27th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 11, which was 2 less than normal; partly cloudy, 9, or 2 less than normal; cloudy, 11, or 4 more than normal. The per cent of possible sunshine was 54, which was 12 per cent below normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 29.99 inches, which was 0.01 inch below normal. The highest reading was 30.32 inches on the 26th at Ridgefield and Verona, and the lowest, 29.68 inches on the 24th at Sandy Hook.

The mean stage of the Delaware River at Phillipsburg was 2.9 feet; and the highest, 6.9 feet on the 29th. At Trenton the daily stage was 1.7 feet, which was 0.6 foot above normal. The highest stage, 4.0 feet on the 31st.

Thunderstorms occurred on the 1st, 2d, 4th to the 9th, inclusive, 13th, 14th, 15th, 18th, 24th, 27th, 29th and 31st. Dense fog was noted on the 2d, 5th, 7th, 22d, 23d, 24th, 28th and 31st. Solar halos were observed on the 16th, 25th and 31st.

A violent wind and rain storm, closely approaching tornadic characteristics caused heavy damage in West Berlin on the 8th. Many buildings were damaged and some totally wrecked. Several persons were hurt with minor injuries. Torrential rain and lightning caused considerable damage in various portions of the State attendant upon the same storm.

Light hail, with no damage fell over the northeastern quarter of the State on the 1st, 2d, 5th, 8th and 29th.

### COMPARATIVE DATA FOR AUGUST

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Union City; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Charlotteburg is Newfoundland.

## Daily Precipitation for August, 1927

VOL. XXXII.

SEPTEMBER, 1927.

No. 9

### GENERAL SUMMARY.

The very generally disagreeable weather of August continued through the first day of September, when a marked change occurred to fair and moderately warm conditions. After the rain of the 1st, there was practically none of importance during the remainder of the month, except for a heavy storm on the 18-19th. This was of course attended by an excess of sunshine and clear skies. The temperature was about equally divided as to frequency and amount of variation above and below normal, so that the month as a whole was one of the most pleasant and favorable for out-of-door pursuits of any during the warmer season of this year. From the 20th to 27th inclusive a period of almost continuously clear and moderately cool weather prevailed. Only in September 1914 and 1916 has there been a larger number of clear days than in September of this year. The weather was especially favorable for the maturity of crops, some of which, because of unfavorable earlier growing weather, seemed not likely to reach full fruition before early frosts. The few occurrences of early frost were not far from their normal date, but were somewhat more restricted in area than usual, and were very generally without much damage.

No storm warnings were displayed during the month.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 36 stations, was 65.6°, which was 0.1° above normal. The highest temperature was 97° at Runyon on the 15th, and the lowest, 29°, at Charlotteburg on the 25th. The greatest daily range of temperature was 46° at Charlotteburg on the 25-26th. The highest monthly mean temperature was 68.8° at Vineland, and the lowest, 61.9° at Charlotteburg.

The temperature departure from the normal for the year, 1927, to date, by sections, is: The Highlands, -0.3°; Red Sandstone Plain, -0.7°; Southern Interior, -0.4°; Sea Coast, -0.1°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 41 stations, was 2.66 inches, which was 1.17 inches below normal.

The greatest monthly precipitation was 5.03 inches, at Little Falls, and the least, 0.65 inch at Phillipsburg. The greatest amount of precipitation in any 24 consecutive hours was 4.48 inches at Little Falls on the 1st. The mean of the number of days on which 0.01 inch or more of precipitation fell was 5, or 3 less than normal.

The precipitation accumulated departure from the normal for the year 1927, to date, by sections, is: The Highlands, -2.60 inches; Red Sandstone Plain, +0.20 inch; Southern Interior, -5.25 inches; Sea Coast, -4.57 inches.

### WIND.

The prevailing wind direction was from the southwest. The wind movement averaged 10 miles per hour, which was 2 miles

below normal. The highest velocity, sustained for 5 consecutive minutes, was 47 miles per hour from the north at Sandy Hook on the 1st. High winds also occurred on the 30th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 19, which was 4 more than normal; partly cloudy, 6, or 2 less than normal; cloudy, 5, or 2 less than normal. The percent of possible sunshine was 70, which was 2 per cent above normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.02 inches, which was 0.05 inch below normal. The highest reading was 30.44 inches at Verona on the 28th, and the lowest 29.50 inches at Trenton and Verona on the 9th and 11th respectively.

The mean stage of the Delaware River at Phillipsburg was 2.9 feet; and the highest, 9.7 feet on the 3d. At Trenton the mean stage was 1.8 feet, which was 0.7 foot above normal. The highest stage, 5.1 feet, occurred on the 3d.

Thunderstorms occurred on the 2d, 10th, 11th, 14th, 15th, 18th, 19th and 20th. Dense fog was noted on the 3d, 4th, 16th, 17th, 21st, 26th and 29th. Solar halos were observed on the 7th, 8th, 14th and 21st. Light frost occurred on the 24th and 25th at some of the following places: Bridgeton, Charlotteburg, Dover, Layton and Runyon and temperatures dropped below freezing at Charlotteburg, Belleplain and Runyon.

### COMPARATIVE DATA FOR SEPTEMBER

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Union City; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Charlotteburg is Newfoundland.

## Daily Precipitation for September, 1927

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXXII.

OCTOBER, 1927.

No. 10

### GENERAL SUMMARY.

The weather during October was notable in several factors. There were four rainstorms each of which amounted to over an inch in nearly all localities, and the last to some four inches in three days, from the 17th to the 20th. This culminated in unusually high water in all streams, ponds, etc. While the freshets assumed menacing aspects, there was no serious damage caused by the high water. Between the rainy periods the weather was fair and mostly warm, with an unusual absence of severe frosts, so that late agriculture continued to grow well to the close of the month. It was the warmest October since 1920, and the rainiest on record with the notable exception of that of 1903. Temperatures were mostly continuously above normal on the first and last eight day periods of the month, and also on the 12th and 13th. These general conditions were favorable to late maturing crops and to general farm and out-door occupations. Crops were practically unhurt by early frosts.

For the calendar year, to date, the combined factors of both precipitation and temperature show the year to be practically normal.

Storm warnings were displayed along the coast on the 3d, 12th, and 17th to 19th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations, was 56.8°, which was 1.8° above normal. The highest temperature was 94° at Belvidere and Bergen Point on the 2d, and the lowest, 23°, at Runyon on the 31st. The greatest daily range of temperature was 46° at Charlotteburg on the 26th. The highest monthly mean temperature was 60.5° at Cape May City, and the lowest, 52.8° at Charlotteburg.

The temperature departure from the normal for the year, 1927, to date, by sections, is: The Highlands, 0.0°; Red Sandstone Plain, -0.4°; Southern Interior, -0.2°; Sea Coast, +0.1°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 43 stations, was 7.82 inches, which was 4.10 inches above normal.

The greatest monthly precipitation was 14.07 inches, at Tuckerton, and the least, 2.81 inches at Cape May City. The greatest amount of precipitation in any 24 consecutive hours was 4.00 inches at Tuckerton on the 12-13th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 10, or 2 more than normal.

The precipitation accumulated departure from the normal for the year 1927, to date, by sections, is: The Highlands, +0.56 inch; Red Sandstone Plain, +4.86 inches; Southern Interior, -1.11 inches; Sea Coast, -0.56 inch.

### WIND.

The prevailing wind direction was from the southwest. The wind movement averaged 15 miles per hour, which was 3 miles above normal. The highest velocity, sustained for 5 consecutive

minutes, was 72 miles per hour from the southeast at Atlantic City on the 4th. High winds also occurred on the 3d, 4th, 12th, 13th, 17th, 18th and 21st.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 18, which was 3 more than normal; partly cloudy, 5, or 3 less than normal; cloudy, 8, or normal. The per cent of possible sunshine was 68, which was 5 per cent above normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.00 inches, which was 0.07 inch below normal. The highest reading was 30.40 inches on the 31st at Riverton and the lowest, 29.15 inches on the 20th at Ridgefield.

The mean stage of the Delaware River at Phillipsburg was 6.2 feet, and the highest stage, 19.0 feet on the 20th. At Trenton the mean stage was 3.4 feet, which was 2.0 feet above normal. The highest stage, 10.9 feet, occurred on the 20th.

Thunderstorms were reported on the 12th, 19th, 20th and 23d. Dense fog occurred on the 2d, 3d, 6th, 10th, 26th, 28th and 29th. A lunar halo was observed on the 17th. Killing frost occurred very generally over extreme northern districts on the 11th, and this frost was heavy over nearly all the northern half. Killing frost occurred practically throughout the State on the 31st.

Moderate hail, with no damage fell on the 19th at Ridgefield.

### COMPARATIVE DATA FOR OCTOBER

| Year      | Temperature |         |        | Precipitation |          |       | No. of days |               |        |                        |

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

‡ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc. T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Union City; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Charlotteburg is Newfoundland.

## CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

Vol. XXXII.

NOVEMBER, 1927.

No. 11

## GENERAL SUMMARY.

Remarkably warm weather prevailed during November, there were eleven days with temperatures slightly subnormal, but the remainder were warm, ranging to twenty degrees above normal, and were continuous for long periods of consecutive days. It has been exceeded by only two Novembers since the compilation of State records commenced in 1885, viz. those of 1896 and 1902.

There was a slight deficiency of sunshine, and a relative excess of cloudiness and rainfall, together with a trifling amount of snow. The cool days were from the 4th to the 11th, 13th and 19th to 21st. The frequency of rain was slightly above normal, and the storms of the 3d and 17th were notably heavy. The warmth and moisture contributed to a very late date for plant growth, and there were scattered occurrences of roses in bloom almost to the close of the month, from central counties southward. Grass and grain were growing with remarkable luxuriance at the close of the month, and there were indications of the swelling of tree buds. The level of ground water was very high, and the mean stage of the Delaware River at Trenton was higher than any previous November record. Wells, springs and ponds were very full, and out door work was hindered because of the ground being too wet.

The accumulation of warmth and moisture for the eleven months of the year are slightly above normal.

Storm warnings were displayed along shore on the 3d, 17th and 30th.

## TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations, was 47.9°, which was 5.0° above normal. The highest temperature was 78° at several stations on the 1st and 2d, and the lowest, 15°, at Runyon on the 20th. The greatest daily range of temperature was 50° at Runyon on the 14th. The highest monthly mean temperature was 51.8° at Vineland, and the lowest, 43.6° at Boonton.

The temperature departure from the normal for the year, 1927, to date, by sections, is: The Highlands, +0.4°; Red Sandstone Plain, 0.0°; Southern Interior, +0.4°; Sea Coast, +0.5°.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 43 stations, was 4.02 inches, which was 0.94 inch above normal. The average total snowfall at eighteen selected stations was 0.1 inch, which was 1.1 inches below normal.

The greatest monthly precipitation was 8.68 inches, at Charlotteburg, and the least, 1.74 inches at Bridgeton. The greatest amount of precipitation in any 24 consecutive hours was 3.45 inches at Charlotteburg on the 17-18th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 11, or 3 more than normal.

The precipitation accumulated departure from the normal for the year 1927, to date, by sections, is: The Highlands, +4.10 inches; Red Sandstone Plain, +5.50 inches; Southern Interior, -1.18 inches; Sea Coast, -0.79 inch.

## WIND.

The prevailing wind direction was from the southwest. The wind movement averaged 13 miles per hour, which was 1 mile below normal. The highest velocity, sustained for 5 consecutive minutes, was 60 miles per hour from the south at Sandy Hook on the 17th. High winds also occurred on the 3d, 6th, 18th and 30th.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 10, which was 2 less than normal; partly cloudy, 8, or normal; cloudy, 12, or 2 more than normal. The per cent of possible sunshine was 48, which was 10 per cent below normal.

## MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 7.4 feet, and the highest stage, 15.0 feet on the 19th. At Trenton the mean daily stage was 4.1 feet, which was 2.3 feet above normal. The highest stage, 8.3 feet on the 19th.

The mean atmospheric pressure, reduced to sea level, was 30.10 inches, which was normal. The highest reading was 30.73 inches at Atlantic City and Trenton on the 13th and the lowest, 29.10 inches at Sandy Hook on the 4th.

Dense fog occurred on the 1st, 2d, 9th, 12th, 15th, 29th and 30th. Thunderstorms were noted on the 3d, 11th, 16th, 17th and 18th. A lunar halo was observed on the 7th.

## COMPARATIVE DATA FOR NOVEMBER

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Union City; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Charlotteburg is Newfoundland.

Daily Precipitation for November, 1927

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXXII.

DECEMBER, 1927.

No. 12

## GENERAL SUMMARY.

The outstanding features of weather conditions during December were three warm periods, one cold wave, one sleet storm, and the absence of snow. The warm periods were the 1st-2d, 6-8th, 11-16th, and 28th through the close of the month. Thermometer readings well up in the 60's on the 8th, were followed by a drop of some 45 to 50 degrees in the following 22 hours. The cold wave resulted in no appreciable damage. A sleet storm on the 4th was widespread and heavy, amounting to 1 to 4 inches or more, and transportation and drainage difficulties were considerably worse than would have been the case with a like amount of snow. During the warm wave of the 7-8th, the sleet disappeared. Very little sleet fell near the shore or in the extreme south. A few negligible flurries of snow occurred, amounting to but a fraction of an inch. The warm weather compared favorably with other warm Decembers in 1923, 1920, 1918, 1913, 1912 and 1911, all of which were slightly warmer than December of this year, so that the record is not greatly remarkable. Wind movement was persistently greater than normal, and gales of moderately damaging force were more than ordinarily frequent. Cold nights commencing during the third week caused small ponds to close with ice, but streams remained mostly open. There was a slight excess of cloudiness and frequency of precipitation, but considering all conditions, it was an exceptionally pleasant month for December.

Storm warnings were displayed along the coast on the 2d, 4th, 7th, 8th, 15th, 16th, 19th, 20th, 29th and 31st.

## TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 37 stations, was 35.3°, which was 2.6° above normal. The highest temperature was 70° at Asbury Park on the 1st and the lowest, 2°, at Runyon on the 27th. The greatest daily range of temperature was 42° at Riverton on the 8th. The highest monthly mean temperature was 39.1° at Atlantic City, and the lowest, 30.7° at Layton.

The temperature departure from the normal for the year, 1927, to date, by sections, is: The Highlands, +0.5°; Red Sandstone Plain, +0.2°; Southern Interior, +0.6°; Sea Coast, +0.6°.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 41 stations, was 4.54 inches, which was 0.63 inch above normal. The average total snowfall at twenty-two selected stations was a Trace, which was 6.4 inches below normal.

The greatest monthly precipitation was 5.76 inches, at Lambertville, and the least, 2.80 inches at Phillipsburg. The greatest amount of precipitation in any 24 consecutive hours was 2.77 inches at Trenton on the 4-5th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 12, or 3 more than normal.

The precipitation accumulated departure from the normal for the year 1927, to date, by sections, is: The Highlands, +4.83 inches; Red Sandstone Plain, +5.99 inches; Southern Interior, -0.58 inch; Sea Coast, +0.21 inch.

## WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 19 miles per hour, which was 5 miles above normal. The highest velocity, sustained for 5 consecutive minutes, was 68 miles per hour from the northeast at Atlantic City on the 4th. High winds also occurred on the 1st, 2d, 4th, 5th, 7th, 8th, 10th, 14th, 16th, 20th and 31st.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 13, which was 1 more than normal; partly cloudy, 6, or 3 less than normal; cloudy, 12, or 2 more than normal. The per cent of possible sunshine was 46, which was 6 per cent below normal.

## MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.07 inches, which was 0.03 inch below normal. The highest reading was 30.67 inches at Ridgefield on the 10th and the lowest, 29.10 inches at Sandy Hook on the 16th.

The mean stage of the Delaware River at Phillipsburg was 7.1 feet, and the highest stage, 15.0 feet on the 9th. At Trenton the mean daily stage was 4.5 feet, which was 1.9 feet above normal. The highest stage was 7.9 feet on the 9th and 10th.

Dense fog was observed on the 12th, 13th, 14th, 16th, 29th, 30th and 31st. Sleet fell on the 2d, 4th, 5th, 11th, 15th and 16th. Solar and lunar halos were observed on the 1st.

## COMPARATIVE DATA FOR DECEMBER

| Year      | Temperature |         |        | Precipitation |           |       |          | No. of days |               |        |                        |

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Union City; Northfield is Pleasantville; Pleasantville and Runyon are Trenton; Charlotteburg is Newfoundland.

Highwood (above)

Precipitation departure:

plus 0.71, should read minus 0.71

Except as otherwise indicated, observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. \*\*\* Regular Weather Bureau station; precipitation is for 24-hour period, midnight to midnight. † Separate dates of falls not recorded. †† Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. § Incomplete or missing. \* Precipitation included in the next following measurement. \*\* Precipitation for 24-hour period from midnight to midnight. T. Trace, or less than 0.01 inch.

TRENTON, N. J.

VOL. XXXII. ANNUAL SUMMARY, 1927. No. 13

## GENERAL SUMMARY.

There were several features of the weather during 1927 which, by accumulation, made the year seem somewhat extraordinary. The five warmer months of the year, April through August, were distinctly subnormal in warmth; while all the colder months of the year, except January, were notably above normal in warmth. The year as a whole consecutive period was but a fraction of a degree above normal. In fact the period of a year is so long that temperatures very closely equalize themselves toward normal. Since 1885, when State averages were first compiled, there has not been one year when temperatures have averaged more than 2.6° above or below normal.

There have been, also, notable features of precipitation. The first half of the year was constantly deficient in precipitation of both rain and snow, except that there was a slight excess of snow in January. But the latter half was excessively rainy, so that the lack of the first half was more than overcome, and the year totaled one of the wettest in the past 25 years. One generous snowstorm occurred on January 15th, but other snows were without importance.

A severe coast storm prevailed on February 19-20th, which caused general damage. March was one of the four driest on record, and was very pleasant. August mean temperature for the State was the lowest on record since State averages have been compiled in 1885, and the weather was noticeably disagreeable because of excessive humidity and fog.

The mean temperature for the year, 52.0°, was 0.4° above normal. The warmest month was July, 72.7°, and the coldest, January, 29.2°. The highest temperature was 99° at Somerville and Runyon on July 13th, and the lowest, 12° below zero at Culvers Lake on January 27th. The highest mean temperature was 54.2° at Burlington, and the lowest, 48.5° at Layton. The greatest annual range of temperature was 104° at Layton.

The average precipitation for the State was 49.68 inches, which was 2.95 inches above normal. The greatest monthly average was 8.55 inches in August, and the least, 1.46 inches in March. The greatest monthly amount of precipitation was 14.07 inches at Tuckerton in October, and the least, 0.65 inch at Phillipsburg in September. The greatest annual precipitation was 61.49 inches at Little Falls, and the least, 31.47 inches at Phillipsburg.

The average snowfall for the State was 13.7 inches, which was 15.2 inches below normal. The greatest annual snowfall was 37.4 inches at Sussex, and the least, 5.3 inches at Atlantic City.

The average number of days on which 0.01 inch or more precipitation occurred was 125, which was 11 more than normal. The average number of clear days was 156, which was 4 more than normal; partly cloudy, 90, which was 19 less than normal; cloudy, 119, which was 15 more than normal.

The prevailing wind direction was from the northwest; the highest velocity was 84 miles per hour from the northeast at Atlantic City on February 20th.

Light hail with no damage fell at Burlington on April 5th, and at Asbury Park on the 21st; over scattered localities on May 15th and over interior localities on May 26th; Ocean and Monmouth counties on July 7th, also over portions of Essex and Bergen counties; on July 27th at Layton; northeastern quarter of the State on August 1st, 2d, 5th, 8th and 29th; and at Ridge-

field on October 19th. The occurrence on May 26th did light damage to a few tender plants in Burlington county.

## COMPARATIVE ANNUAL DATA FOR THE STATE

| Year | Temperature |         |        | Average precipitation | Average snowfall | Year | Temperature |         |        | Average precipitation | Average snowfall |
